

TERRAX MINERALS INC.

CONDENSED INTERIM FINANCIAL STATEMENTS

April 30, 2014

(Expressed in Canadian Dollars)

NOTICE TO READER

Under National Instrument 51-102, Part 4, subsection 4.3(3)(a), if an auditor has not performed a review of the condensed interim financial statements, they must be accompanied by a notice indicating that the financial statements have not been reviewed by an auditor.

The accompanying unaudited condensed interim consolidated financial statements have been prepared by and are the responsibility of the management.

The Company's independent auditor has not performed a review of these condensed interim financial statements in accordance with the standards established by the Canadian Institute of Chartered Accountants for a review of condensed interim financial statements by an entity's auditor.

Supplemental cash flow information (Note 14)

The accompanying notes are an integral part of these financial statements.

1. NATURE AND CONTINUANCE OF OPERATIONS

TerraX Minerals Inc. (the “Company”) was incorporated under the Business Corporations Act (British Columbia) on August 1, 2007 and its principal activity is the exploration and development of mineral properties in Canada. The Company trades on the TSX Venture Exchange (“TSX-V”).

The head office, principal and registered address and records office of the Company are located at suite 2300-1066 West Hastings Street, Vancouver, British Columbia, Canada, V6E 3X2.

These financial statements have been prepared on the assumption that the Company will continue as a going concern, meaning it will continue in operation for the foreseeable future and will be able to realize assets and discharge liabilities in the ordinary course of operations. Different bases of measurement may be appropriate if the Company is not expected to continue operations for the foreseeable future. As at April 30, 2014 the Company had not advanced its properties to commercial production and is not able to finance day to day activities through operations. These uncertainties may cast significant doubt about the Company’s ability to continue as a going concern. The Company’s continuation as a going concern is dependent upon the successful results from its mineral property exploration activities and its ability to attain profitable operations and generate funds there from and/or raise equity capital or borrowings sufficient to meet current and future obligations. Management believes that the Company has sufficient funds to finance operating costs over the next twelve months (Note 13).

These financial statements do not include any adjustments relating to the recoverability and classification of recorded asset amounts and classification of liabilities that might be necessary should the Company be unable to continue in existence.

2. SIGNIFICANT ACCOUNTING POLICIES AND BASIS OF PREPARATION

These financial statements were authorized for issue on June 27, 2014 by the directors of the Company.

Statement of compliance to International Financial Reporting Standards (“IFRS”)

These financial statements, including comparatives, have been prepared in accordance with IFRS as issued by the International Accounting Standards Board (“IASB”) and interpretations issued by the International Financial Reporting Interpretations Committee (“IFRIC”).

Basis of presentation

These financial statements of the Company have been prepared on an accrual basis and are based on historical costs, modified where applicable. The financial statements are presented in Canadian dollars, the Company’s functional currency, unless otherwise noted.

Significant estimates and assumptions

The preparation of financial statements in accordance with IFRS requires the Company to make estimates and assumptions concerning the future. The Company’s management reviews these estimates and underlying assumptions on an ongoing basis, based on experience and other factors, including expectations of future events that are believed to be reasonable under the circumstances. Revisions to estimates are adjusted for prospectively in the period in which the estimates are revised.

Estimates and assumptions where there is significant risk of material adjustments to assets and liabilities in future accounting periods include stock-based awards and payments assumptions, the recoverability of the carrying value of exploration and evaluation assets, fair value measurements for financial instruments, the recoverability and measurement of deferred tax assets and provisions for restoration and environmental obligations.

2. SIGNIFICANT ACCOUNTING POLICIES AND BASIS OF PREPARATION (cont'd)

Significant judgments

The preparation of financial statements in accordance with IFRS requires the Company to make judgments, apart from those involving estimates, in applying accounting policies. The most significant judgments in applying the Company's financial statements include:

- the assessment of the Company's ability to continue as a going concern and whether there are events or conditions that may give rise to significant uncertainty; and
- the classification / allocation of expenditures as exploration and evaluation expenditures or operating expenses.

Exploration and evaluation expenditures

Exploration and evaluation expenditures include the costs of acquiring licenses, costs associated with exploration and evaluation activity, and the fair value (at acquisition date) of exploration and evaluation assets acquired in a business combination. Exploration and evaluation expenditures are capitalized. Costs incurred before the Company has obtained the legal rights to explore an area are recognized in profit or loss.

Government tax credits received are recorded as a reduction to the cumulative costs incurred and capitalized on the related property.

Exploration and evaluation assets are assessed for impairment if (i) sufficient data exists to determine technical feasibility and commercial viability, and (ii) facts and circumstances suggest that the carrying amount exceeds the recoverable amount.

Once the technical feasibility and commercial viability of the extraction of mineral resources in an area of interest are demonstrable, exploration and evaluation assets attributable to that area of interest are first tested for impairment and then reclassified to mining property and development assets within property, plant and equipment.

Recoverability of the carrying amount of any exploration and evaluation assets is dependent on successful development and commercial exploitation, or alternatively, sale of the respective areas of interest.

Farm outs

The Company does not record any expenditure made by the farmee on its account. It also does not recognize any gain or loss on its exploration and evaluation farm out arrangements but reallocates any costs previously capitalized in relation to the whole interest as relating to the partial interest retained and any consideration received directly from the farmee is credited against costs previously capitalized.

Share-based payments

The Company operates a stock option plan. Share-based payments to employees are measured at the fair value of the instruments issued and amortized over the vesting periods. Share-based payments to non-employees are measured at the fair value of goods or services received or the fair value of the equity instruments issued, if it is determined the fair value of the goods or services cannot be reliably measured, and are recorded at the date the goods or services are received. The corresponding amount is recorded to the option reserve. The fair value of options is determined using the Black-Scholes Option Pricing Model which incorporates all market vesting conditions. The number of shares and options expected to vest is reviewed and adjusted at the end of each reporting period such that the amount recognized for services received as consideration for the equity instruments granted shall be based on the number of equity instruments that eventually vest.

2. SIGNIFICANT ACCOUNTING POLICIES AND BASIS OF PREPARATION (cont'd)

Loss per share

Basic loss per share is calculated by dividing the loss attributable to common shareholders by the weighted average number of common shares outstanding in the period. For all periods presented, the loss attributable to common shareholders equals the reported loss attributable to owners of the Company. Diluted loss per share is calculated by the treasury stock method. Under the treasury stock method, the weighted average number of common shares outstanding for the calculation of diluted loss per share assumes that the proceeds to be received on the exercise of dilutive share options and warrants are used to repurchase common shares at the average market price during the period.

Financial instruments

The Company classifies its financial instruments in the following categories: at fair value through profit or loss ("FVTPL"), loans and receivables, held-to-maturity investments, available-for-sale and financial liabilities. The classification depends on the purpose for which the financial instruments were acquired. Management determines the classification of its financial instruments at initial recognition.

Financial assets are classified at fair value through profit or loss when they are either held for trading for the purpose of short-term profit taking, derivatives not held for hedging purposes, or when they are designated as such to avoid an accounting mismatch or to enable performance evaluation where a Company of financial assets is managed by key management personnel on a fair value basis in accordance with a documented risk management or investment strategy. Such assets are subsequently measured at fair value with changes in carrying value being included in profit or loss.

Loans and receivables are non-derivative financial assets with fixed or determinable payments that are not quoted in an active market and are subsequently measured at amortized cost. They are included in current assets, except for maturities greater than 12 months after the end of the reporting period. These are classified as non-current assets.

Held-to-maturity investments are non-derivative financial assets that have fixed maturities and fixed or determinable payments, and it is the Company's intention to hold these investments to maturity. They are subsequently measured at amortized cost. Held-to-maturity investments are included in non-current assets, except for those which are expected to mature within 12 months after the end of the reporting period.

Available-for-sale financial assets are non-derivative financial assets that are designated as available-for-sale or are not suitable to be classified as financial assets at fair value through profit or loss, loans and receivables or held-to-maturity investments and are subsequently measured at fair value. These are included in current assets. Unrealized gains and losses are recognized in other comprehensive income, except for impairment losses and foreign exchange gains and losses.

Non-derivative financial liabilities (excluding financial guarantees) are subsequently measured at amortized cost. Regular purchases and sales of financial assets are recognized on the trade-date – the date on which the Company commits to purchase the asset.

Financial assets are derecognized when the rights to receive cash flows from the investments have expired or have been transferred and the Company has transferred substantially all risks and rewards of ownership.

At each reporting date, the Company assesses whether there is objective evidence that a financial instrument has been impaired. In the case of available-for-sale financial instruments, a significant and prolonged decline in the value of the instrument is considered to determine whether an impairment has arisen.

The Company does not have any derivative financial assets and liabilities.

2. SIGNIFICANT ACCOUNTING POLICIES AND BASIS OF PREPARATION (cont'd)

Impairment of assets

The carrying amount of the Company's long-lived assets (which include exploration and evaluation assets) is reviewed at each reporting date to determine whether there is any indication of impairment. If such indication exists, the recoverable amount of the asset is estimated in order to determine the extent of the impairment loss. An impairment loss is recognized whenever the carrying amount of an asset or its cash generating unit exceeds its recoverable amount. Impairment losses are recognized in the statement of comprehensive loss.

The recoverable amount of assets is the greater of an asset's fair value less cost to sell and value in use. In assessing value in use, the estimated future cash flows are discounted to their present value using a pre-tax discount rate that reflects the current market assessments of the time value of money and the risks specific to the asset. For an asset that does not generate cash inflows largely independent of those from other assets, the recoverable amount is determined for the cash-generating unit to which the asset belongs.

An impairment loss is only reversed if there is an indication that the impairment loss may no longer exist and there has been a change in the estimates used to determine the recoverable amount, however, not to an amount higher than the carrying amount that would have been determined had no impairment loss been recognized in previous years.

Assets that have an indefinite useful life are not subject to amortization and are tested annually for impairment.

Cash and cash equivalents

Cash and cash equivalents include cash on hand, deposits held at call with banks, other short-term highly liquid investments with original maturities of three months or less, and bank overdrafts.

Income taxes

Current income tax:

Current income tax assets and liabilities for the current period are measured at the amount expected to be recovered from or paid to the taxation authorities. The tax rates and tax laws used to compute the amount are those that are enacted or substantively enacted, at the reporting date, in the countries where the Company operates and generates taxable income.

Current income tax relating to items recognized directly in other comprehensive income or equity is recognized in other comprehensive income or equity and not in profit or loss. Management periodically evaluates positions taken in the tax returns with respect to situations in which applicable tax regulations are subject to interpretation and establishes provisions where appropriate.

Deferred income tax:

Deferred income tax is provided using the asset and liability method on temporary differences at the reporting date between the tax bases of assets and liabilities and their carrying amounts for financial reporting purposes.

The carrying amount of deferred income tax assets is reviewed at the end of each reporting period and recognized only to the extent that it is probable that sufficient taxable profit will be available to allow all or part of the deferred income tax asset to be utilized.

Deferred income tax assets and liabilities are measured at the tax rates that are expected to apply to the year when the asset is realized or the liability is settled, based on tax rates (and tax laws) that have been enacted or substantively enacted by the end of the reporting period.

Deferred income tax assets and deferred income tax liabilities are offset if a legally enforceable right exists to set off current tax assets against current income tax liabilities and the deferred income taxes relate to the same taxable entity and the same taxation authority.

2. SIGNIFICANT ACCOUNTING POLICIES AND BASIS OF PREPARATION (cont'd)

Income taxes (cont'd)

Flow-through shares:

The Company renounces qualifying Canadian exploration expenditures to certain share subscribers who subscribe for flow-through shares in accordance with the Income Tax Act (Canada). Under these provisions, the Company is required to incur and renounce qualifying expenditures on a timely basis for the respective flow-through subscriptions and, accordingly, it is not entitled to the related tax deductions and tax credits for such expenditures.

Any premium received by the Company on the issuance of flow-through shares is initially recorded as a liability ("flow-through tax liability") and included in trade payables and accrued liabilities. A deferred tax liability is recognized and the flow-through tax liability will be reversed provided that the Company has renounced, or there is reasonable expectation that the Company will renounce, the tax benefits associated with the related expenditures. To the extent that suitable deferred tax assets are available, the Company will reduce the deferred tax liability.

Restoration and environmental obligations

The Company recognizes liabilities for statutory, contractual, constructive or legal obligations associated with the retirement of long-term assets, when those obligations result from the acquisition, construction, development or normal operation of the assets. The net present value of future restoration cost estimates arising from the decommissioning of plant and other site preparation work is capitalized to exploration and evaluation assets along with a corresponding increase in the restoration provision in the period incurred. Discount rates using a pre-tax rate that reflect the time value of money are used to calculate the net present value. The restoration asset will be depreciated on the same basis as other mining assets.

The Company's estimates of restoration costs could change as a result of changes in regulatory requirements, discount rates and assumptions regarding the amount and timing of the future expenditures. These changes are recorded directly to mining assets with a corresponding entry to the restoration provision. The Company's estimates are reviewed annually for changes in regulatory requirements, discount rates, effects of inflation and changes in estimates.

Changes in the net present value, excluding changes in the Company's estimates of reclamation costs, are charged to profit and loss for the period. The net present value of restoration costs arising from subsequent site damage that is incurred on an ongoing basis during production are charged to profit or loss in the period incurred. The costs of restoration projects that were included in the provision are recorded against the provision as incurred. The costs to prevent and control environmental impacts at specific properties are capitalized in accordance with the Company's accounting policy for exploration and evaluation assets.

As at April 30, 2014, the Company has no known material restoration and environmental obligations.

Adoption of new and revised standards

The following standards, amendments and interpretations have been adopted by the Company as of February 1, 2013. There was no impact on the financial statements as a result of the adoption of these standards, amendments and interpretations:

- a) IFRIC 20 Stripping Costs in the Production Phase of a Surface Mine (New).
- b) IFRS 10 Consolidated Financial Statements (New; to replace consolidation requirements in IAS 27 (as amended in 2008) and SIC-12);
- c) IFRS 11 Joint Arrangements (New; to replace IAS 31 and SIC-13);
- d) IFRS 12 Disclosure of Interests in Other Entities (New; to replace disclosure requirements in IAS 27 (as amended in 2008), IAS 28 (as revised in 2003) and IAS 31);
- e) IFRS 13 Fair Value Measurement (New; to replace fair value measurement guidance in other IFRSs);

TERRAX MINERALS INC.
NOTES TO THE CONDENSED INTERIM FINANCIAL STATEMENTS
(Expressed in Canadian dollars - unaudited)
For the three months ended April 30, 2014 and 2013

2. SIGNIFICANT ACCOUNTING POLICIES AND BASIS OF PREPARATION (cont'd)

Adoption of new and revised standards (cont'd)

- f) IAS 1 Presentation of Financial Statements, (Amendments regarding Presentation of Items of Other Comprehensive Income);
- g) IAS 19 Employee Benefits (Amended in 2011);
- h) IAS 27 Separate Financial Statements (Amended in 2011); and
- i) IAS 28 Investments in Associates and Joint Ventures (Amended in 2011).

3. ACCOUNTING STANDARDS ISSUED BUT NOT EFFECTIVE

Certain pronouncements were issued by the IASB or the IFRIC that are mandatory for accounting periods beginning after January 1, 2014 or later periods.

- a) IFRS 9 Financial Instruments (New; to replace IAS 39 and IFRIC 9);
- b) IFRIC 21 Levies (Interpretation of IAS 37); and
- c) IAS 32 Financial Instruments (Amended in 2011).

The above new standards, amendments and interpretations that have not been early adopted in these financial statements, is not expected to have a material effect on the Company's future results and financial position.

Other accounting standards or amendments to existing accounting standards that have been issued but have future effective dates are either not applicable or not expected to have a significant impact on the Company's financial statements

4. CASH AND CASH EQUIVALENTS

The components of cash and cash equivalents are as follows:

	April 30, 2014	January 31, 2014
Cash at bank	\$ 140,137	\$ 330,703
Term deposits	2,065,873	1,325,000
	\$ 2,206,010	\$ 1,655,703

At April 30, 2014, the Company has variable rate investments of \$2,065,873 (January 31, 2014 - \$1,325,000) yielding a variable interest rate of prime less 1.70%. The term deposits allow for early redemption after the first 30 days of investment and mature on various dates.

5. RECEIVABLES

Receivables consist of the following:

	April 30, 2014	January 31, 2014
GST receivable	\$ 61,244	\$ 31,509
Interest receivable	10,880	5,188
	\$ 72,124	\$ 36,697

TERRAX MINERALS INC.**NOTES TO THE CONDENSED INTERIM FINANCIAL STATEMENTS**

(Expressed in Canadian dollars - unaudited)

For the three months ended April 30, 2014 and 2013

6. MARKETABLE SECURITIES

In May 2013 the Company received an option payment, consisting of 20,000 shares with a market value of \$200,000 from Virginia Mines Inc. (TSX: VGQ). The Company recorded these available for sale shares at their fair value. During the year ended January 31, 2014 the Company disposed of these shares and realized a gain of \$65,873 on the sale of these marketable securities.

7. SECURITY DEPOSITS

A security deposit of \$70,000 has been deposited with the minister of Aboriginal Affairs and Northern Development Canada for a land use permit issued by the Mackenzie Valley Land and Water Board ("MVLWB") for the Company's exploration properties in the Northwest Territories. The deposit will be refunded once the land use permit ends and a final report describing land use activities during the term of the permit and subsequent reclamation activities has been submitted to the MVLWB.

8. EXPLORATION AND EVALUATION ASSETS

Title to exploration and evaluation assets involves certain inherent risks due to the difficulties of determining the validity of certain claims, as well as the potential for problems arising from the frequently ambiguous conveyance history characteristic of many mining properties. The Company has investigated title to all of its mineral properties and, to the best of its knowledge, title to all of its properties are in good standing.

The following are details of the Company's exploration and evaluation assets:

	Blackfly	Central Canada	Stewart	Northbelt	Walsh Lake	Total
Balance, January 31, 2013	\$ 550,309	\$267,844	\$ 1,262,493	-	-	\$ 2,080,646

8. EXPLORATION AND EVALUATION ASSETS (Cont'd)

Blackfly Property, Ontario

On July 2, 2009 the Company entered into an option agreement to acquire a 100% interest in the Blackfly Property located in Northwest Ontario, for the following consideration:

- \$10,000 (paid) and the issuance of 50,000 common shares (issued, with a fair value of \$6,250) upon TSX-V approval of the option agreement;
- \$20,000 (paid), the issuance of 60,000 common shares (issued, with a fair value of \$21,300) and incurring \$25,600 in exploration work by July 2, 2010 (completed);
- \$30,000 (paid), the issuance of 70,000 common shares (issued, with a fair value of \$13,300) and incurring an additional \$25,600 in exploration work by July 2, 2011 (completed);
- \$40,000 (paid), the issuance of 100,000 common shares (issued, with a fair value of \$8,500) and incurring an additional \$51,200 in exploration work by July 2, 2012 (completed); and
- incurring an additional \$76,800 in exploration work by July 2, 2013 (completed).

To January 31, 2014 the Company had incurred \$401,827 (January 31, 2013 - \$400,959) in exploration work on the Blackfly Property.

The Blackfly Property is subject to a 2.5% NSR. The Company has the right to purchase 1% of the 2.5% NSR for \$1,000,000, or in increments of \$500,000 per 0.5%. A pre-production royalty of \$10,000 per year is to be in effect, with the first payment to be made annually, with the first payment due and paid on July 2, 2013. This payment is to continue annually until production commences on the Blackfly Property and this amount will be deducted from any royalties payable by the Company. During the year ended January 31, 2014, the Company paid \$10,000 (January 31, 2013 - \$Nil) for the annual pre-production royalty.

As at January 31, 2014, the Company does not intend to conduct any work on the property in the immediate future, due to market conditions. As a result, the Blackfly Property was written-off at January 31, 2014.

Central Canada Property, Ontario

On December 11, 2009, and as amended on December 5, 2012, the Company entered into an option agreement to acquire a 100% interest in the Central Canada Property located in Northwest Ontario, for the following consideration:

- \$8,000 (paid) and the issuance of 50,000 common shares (issued, with a fair value of \$14,750) upon TSX-V approval of the option agreement;
- \$20,000 (paid), the issuance of 60,000 common shares (issued, with a fair value of \$17,700) and incurring \$20,000 in exploration work by December 11, 2010 (completed);
- \$30,000 (paid), the issuance of 70,000 common shares (issued, with a fair value of \$5,950) and incurring an additional \$20,000 in exploration work by December 11, 2011 (completed);
- \$20,000 (paid), the issuance of 100,000 common shares (issued, with a fair value of \$4,500) and incurring an additional \$40,000 in exploration work by December 11, 2012 (completed);
- the payment of \$20,000 by March 31, 2013 (paid) and
- incurring an additional \$60,000 in exploration work by December 11, 2013 (completed).

To April 30, 2014, the Company has incurred \$146,944 (January 31, 2014 - \$146,944) in exploration work on the Central Canada Property.

8. **EXPLORATION AND EVALUATION ASSETS (cont'd)**

Central Canada Property, Ontario (cont'd)

The Central Canada Property is subject to a 2.5% NSR. The Company has the right, at any time, to purchase 1% of the 2.5% NSR for \$1,000,000, or in increments of \$500,000 per 0.5%. A pre-production royalty of \$10,000 per year is to be in effect, with the first payment to be made on December 11, 2013. This payment is to continue annually until production commences on the Central Canada Property and this amount will be deducted from royalties payable by the Company. During the year ended January 31, 2014, the Company paid \$10,000 for the annual pre-production royalty.

On February 24, 2014, the Company entered into an option agreement with Alberta Star Development Corp. ("Alberta Star"), a company related by a common director, whereby Alberta Star can earn up to a 60% in the Central Canada Property by making cash payments to the Company totaling \$85,000 over a three year period, with \$10,000 due upon execution of the option agreement (paid), \$25,000 due on the second anniversary of the option agreement, and the remaining \$50,000 due on the third anniversary. Alberta Star must also incur an aggregate of \$500,000 in exploration expenditures over a three year period, with \$100,000 due by March 31, 2015, \$150,000 due by March 31, 2016 and \$250,000 due on March 31, 2017. Alberta Star will also be responsible for payment of the annual pre-production royalty of \$10,000 to the original vendors of the property due annually in December.

Stewart Property, Newfoundland

On June 28, 2010, and as amended on February 21, 2012 and September 26, 2012, the Company entered into an option agreement to acquire a 100% interest in the Stewart Property located in the Burin Peninsula of Newfoundland, for following consideration:

- \$10,000 (paid) and the issuance of 30,000 common shares (issued, with a fair value of \$11,550) upon TSX-V approval of the option agreement;
- \$20,000 (paid), the issuance of 40,000 common shares (issued, with a fair value of \$8,800) and incurring \$75,000 in exploration work by April 13, 2011 (completed);
- \$25,000 (paid), the issuance of 50,000 common shares (issued, with a fair value of \$4,000) and incurring an additional \$100,000 in exploration work by April 13, 2012 (completed);
- the payment of \$25,000 by September 30, 2012 (paid);
- the issuance of 75,000 common shares (issued, with a fair value of \$17,250) and incurring an additional \$150,000 in exploration work by April 13, 2013 (completed); and
- the issuance of 100,000 common shares (issued, with a fair value of \$62,000) and incurring an additional \$200,000 in exploration work by April 13, 2014 (completed).

To April 30, 2014, the Company paid \$3,789 in staking costs. To April 30, 2014, the Company has incurred \$1,170,378, net of a \$100,000 government grant received in April 2012, in exploration work on the Stewart Property.

The Stewart Property is subject to a 2% NSR. The Company has the right, at any time, to purchase 1% the 2% NSR for \$1,000,000.

8. EXPLORATION AND EVALUATION ASSETS (cont'd)

Northbelt Property, Northwest Territories

On December 17, 2012, the Company submitted an offer to acquire a 100% interest in 121 mineral leases totaling 8802 acres (3562 hectares) approximately 15 km north of the city of Yellowknife known as the Northbelt Property. As consideration, the Company paid a refundable deposit of \$21,100 on December 19, 2012 with the balance of the purchase price of \$189,900 paid on closing of the transaction in February 2013.

In May 2013, the Company acquired 12 mineral claims called the **Goodwin Claims** from Sonde Resources Corp. for \$10,000. These claims have been incorporated into the Northbelt project area. The Company acquired a 100% interest in the claims. During the year ended January 31, 2014, the Company paid annual mineral lease payments of \$17,374.

Concurrent with completion of a private placement by Virginia Mines Inc. ("Virginia") (TSX: VGQ) in May 2013, the Company granted Virginia an option to acquire a 2% smelter returns royalty on the Northbelt property. Virginia may exercise the option by payment of \$2,000,000 within three months following commencement of production. In consideration of granting the option, the Company received 20,000 common shares of Virginia at a market value of \$10 per share, the value of which was applied to reduce the acquisitions costs recorded for Northbelt by \$200,000 during the period.

In March, 2014 the Company issued 75,000 shares to acquire the **UBreccia Property**, which is contiguous with and immediately west-southwest of its Northbelt Property in the Northwest Territories. These claims have been incorporated into the Northbelt project area. The vendor will retain a 1% net smelter returns royalty, of which 0.5% can be purchased by the Company at any time for \$1,000,000.

To April 30, 2014, the Company has incurred \$1,617,864 in exploration work on the Northbelt Property.

Walsh Lake Property, Northwest Territories

On October 28, 2013, the Company entered into an option agreement to acquire a 100% interest in the Walsh Lake Property, which is contiguous with and immediately east of its Northbelt Property, for the following consideration:

- \$5,000 (paid) and the issuance of 30,000 common shares (issued, with a fair value of \$13,500) upon execution of the agreement;
- \$10,000, the issuance of 40,000 common shares and incurring \$25,000 in exploration work by October 28, 2014;
- \$20,000, the issuance of 50,000 common shares and incurring an additional \$55,000 in exploration work by October 28, 2015;
- \$25,000, the issuance of 70,000 common shares and incurring an additional \$70,000 in exploration work by October 28, 2016; and
- \$30,000, the issuance of 70,000 common shares and incurring an additional \$250,000 in exploration work by October 28, 2017.

The vendor will retain a 2% NSR, of which 1.5% can be purchased by the Company for \$2,000,000.

During the year ended January 31, 2014, the Company also recognized in acquisition costs of \$3,992 in claim fees.

(Expressed in Canadian dollars - unaudited)
For the three months ended April 30, 2014 and 2013

9. TRADE PAYABLES AND ACCRUED LIABILITIES

Trade payables and accrued liabilities consist of the following:

	April 30, 2014	January 31, 2014
Trade payables	\$ 281,993	\$ 58,303
Due to related parties (Note 9)	120,128	78,477
Accrued liabilities	20,000	20,000
	\$ 422,121	\$ 156,780

10. RELATED PARTY TRANSACTIONS

Related party balances

As at April 30, 2014, \$120,128 (January 31, 2014 - \$78,477) was due to directors or companies controlled by directors and recorded in trade payables and accrued liabilities. These amounts are unsecured, non-interest bearing with no fixed terms of repayment.

Related party transactions

The Company's related parties include key management. Key management includes executive directors and non-executive directors. The remuneration of the key management of the Company as defined above was as follows:

	Three months ended	
	April 30, 2014	April 30, 2013
Rent and administrative services	\$ 9,000	\$ 4,500
Consulting fees	10,350	8,025
Geological consulting – Exploration and evaluation assets	117,566	33,719
	\$ 136,916	\$ 46,244

11. SHARE CAPITAL

Authorized share capital

Unlimited number of voting common shares without par value.

Issued share capital

At April 30, 2014 there were 43,774,040 issued and fully paid common shares (January 31, 2014 – 39,918,140).

2015

- a) During the three months ended April 30, 2014, the Company issued 175,000 common shares at a fair value of \$118,250 towards consideration for the acquisition of exploration and evaluation assets (Note 7).
- b) The Company completed a private placement of 1,500,000 units at \$0.45 per unit for gross proceeds of \$675,000. Each unit consists of one common share and one-half of one share purchase warrant, with each full warrant entitling the holder to purchase an additional common share at an exercise price of \$0.51 per share until February 14, 2016. Finder's fees of \$31,500 were paid with respect to a portion of this private placement along with the issuance of 70,000 finder's warrants exercisable at \$0.51 until February 14, 2016, with a fair value of \$25,463. The total fair value of \$25,463 was estimated using the Black-Scholes Option Pricing Model assuming an expected life of 2 years, a risk-free interest rate of 1.03% and an expected volatility of 130.66%.

11. SHARE CAPITAL (cont'd)

2015 (cont'd)

- c) The Company completed a private placement whereby Alberta Star Development Corp. acquired 1,300,000 units of the Company at \$0.45 per unit for gross proceeds of \$585,000 (Note 7). Each unit consists of one common share and one-half of one share purchase warrant, with each full warrant entitling the holder to purchase an additional common share at an exercise price of \$0.57 per share until February 28, 2016.
- d) The Company received net proceeds of \$50,000 from the exercise of 500,000 stock options at \$0.10 per share and the fair value of these options of \$25,463 was reclassified from share-based payment reserve to share capital.
- e) The Company received net proceeds of \$94,270 from the exercise of 280,900 warrants at \$0.30 per share and 100,000 warrants at \$0.10 per share.

2014

- a) During the year ended January 31, 2014, the Company issued 105,000 common shares at a fair value of \$30,750 towards consideration for the acquisition of exploration and evaluation assets (Note 7).
- b) On May 30, 2013, the Company completed a non-brokered private placement of 6,911,085 units at a price of \$0.20 per unit for gross proceeds of \$1,382,217, of which 3,617,085 units were acquired by Virginia. Each unit consists of one common share and one-half of one share purchase warrant, exercisable to purchase an additional share at \$0.30 until May 8, 2016 (as to 3,393,043 warrants) and May 30, 2016 (as to 62,500 warrants). The Company has not separately disclosed the fair value of the warrants. Finders' fees of \$21,840 were paid with respect to this placement along with the issuance of 109,200 finders' warrants exercisable at \$0.30 until May 8, 2016, with a fair value of \$18,118. The total fair value of \$18,118 was estimated using the Black-Scholes Option Pricing Model assuming an expected life of 3 years, a risk-free interest rate of 1.08% and an expected volatility of 155.06%. In connection with this private placement, the Company incurred an additional \$6,786 of share issuance costs.
- c) On December 20, 2013 the Company completed an initial closing of 2,261,812 units at \$0.45 per unit for gross proceeds of \$1,017,815. Each unit consists of one common share and one-half of one share purchase warrant, with each full warrant entitling the holder to purchase an additional common share at an exercise price of \$0.50 per share until December 20, 2015. Finder's fees of \$25,773 were paid with respect to a portion of this placement along with the issuance of 56,574 finders warrants exercisable at \$0.50 until December 20, 2015, with a fair value of \$13,869. The total fair value of \$13,869 was estimated using the Black-Scholes Option Pricing Model assuming an expected life of 3 years, a risk-free interest rate of 1.14% and an expected volatility of 122.43%. In connection with this private placement, the Company incurred an additional \$5,565 of share issuance costs.

On December 27, 2013 issued a further 211,112 units at \$0.45 per unit, for gross proceeds of \$95,000, bringing the aggregate gross proceeds raised in this private placement to \$1,112,816. Each unit consists of one common share and one-half of one share purchase warrant, with each full warrant entitling the holder to purchase an additional common share at an exercise price of \$0.50 per share until December 27, 2015. In connection with these units subscribed, the Company issued additional 700 finders warrants exercisable at \$0.50 until December 27, 2015.
- d) During the year ended January 31, 2014 the Company received net proceeds of \$198,000 from the exercise of 600,000 options at \$0.33 per share and the fair value of these options of \$82,668 was reclassified from share-based payment reserve to share capital.

Stock options

The Board of Directors of the Company has adopted a stock option plan which permits the Company to grant to directors, officers and consultants of the Company, non-transferable options to purchase common shares, provided that the number of common shares reserved for issuance will not exceed 10% of the issued and outstanding common shares and be exercisable for a period of up to five years from the date of grant. The number of common shares reserved for issuance to any individual director or officer will not exceed 5% of the issued and outstanding common shares and the number of common shares reserved for issuance to any one consultant or individual conducting investor relations activities will not exceed 2% of the issued and outstanding common shares. Options granted typically vest on the grant date.

The changes in options during the three months ended April 30, 2014 and 2013 are as follows:

	Three months ended April 30, 2014		Three months ended April 30, 2013	
	Number of options	Weighted average exercise price	Number of options	Weighted average exercise price
Options outstanding, beginning of the period	3,955,000	\$ 0.19	2,500,000	\$ 0.20
Options granted	1,050,000	0.75	-	-
Options exercised	(500,000)	0.10	-	-
Options expired	-	-	-	-
Options outstanding, end of the period	4,505,000	\$ 0.33	2,500,000	\$ 0.20
Options exercisable, end of the period	4,415,000	\$ 0.33	2,500,000	\$ 0.20

2015

On March 14, 2014 the Company granted 1,050,000 stock options to directors and consultants that can be exercised at \$0.75 per share until March 14, 2019. These options vested immediately. The total fair value of \$661,698 was estimated using the Black-Scholes Option Pricing Model assuming an expected life of 5 years, a risk-free interest rate of 1.60% and an expected volatility of 123.81%. The granting of these options resulted in a stock based compensation expense of \$661,698 being recorded during the three months ended April 30, 2014.

2014

On December 23, 2013 the Company granted 295,000 stock options to consultants at an exercise price of \$0.45 per share for a three year period. These options vested immediately. The total fair value of \$83,865 was estimated using the Black-Scholes Option Pricing Model assuming an expected life of 3 years, a risk-free interest rate of 1.14% and an expected volatility of 115.07%. The granting of these options resulted in a stock based compensation expense of \$83,685 being recorded during the year ended January 31, 2014.

On September 30, 2013, the Company granted 100,000 stock options to consultants at an exercise price of \$0.61 per share for a three year period. These options vested immediately. The total fair value of \$43,346 was estimated using the Black-Scholes Option Pricing Model assuming an expected life of 3 years, a risk-free interest rate of 1.40% and an expected volatility of 120.78%. The granting of these options resulted in a stock based compensation expense of \$43,346 being recorded during the year ended January 31, 2014.

Stock options (cont'd)

On August 29, 2013, the Company granted 360,000 stock options to a consultant at an exercise price of \$0.29 per share for a five year period. These options vested 25% upon grant and 25% every 3 months thereafter. The total fair value of \$155,708 was estimated using the Black-Scholes Option Pricing Model assuming an expected life of 5 years, a weighted average risk-free interest rate of 1.63% and a weighted average expected volatility of 130.62%. The granting of these options resulted in a stock based compensation expense of \$128,218 being recorded during the year ended January 31, 2014.

On June 28, 2013, the Company granted 550,000 stock options to consultants at an exercise price of \$0.17 per share for a five year period. These options vested 25% upon grant and 25% every 3 months thereafter. As at January 31, 2014, the total fair value of \$226,433 was estimated using the Black-Scholes Option Pricing Model assuming an expected life of 5 years, a weighted average risk-free interest rate of 1.74% and a weighted average expected volatility of 135.43%. The granting of these options resulted in a stock based compensation expense of \$211,220 being recorded during the year ended January 31, 2014.

On June 28, 2013, the Company also granted 1,500,000 stock options to directors, officers and consultants at an exercise price of \$0.17 per share for a five year period. These options vested immediately upon grant. The total fair value of \$204,953 was estimated using the Black-Scholes Option Pricing Model assuming an expected life of 5 years, a risk-free interest rate of 1.80% and an expected volatility of 152.82%. The granting of these options resulted in a stock based compensation expense of \$204,953 being recorded during the year ended January 31, 2014.

The following incentive stock options were outstanding and exercisable at April 30, 2014:

Number of options outstanding	Number of options exercisable	Exercise price	Expiry date
650,000	650,000	0.10	August 2, 2014
2,050,000	1,912,500	0.17	June 28, 2018
360,000	180,000	0.29	August 29, 2018
100,000	100,000	0.61	September 30, 2016
295,000	295,000	0.45	December 23, 2016
1,050,000	1,050,000	0.75	March 14, 2019
4,505,000	4,415,000		

As at April 30, 2014, the weighted average remaining life of options outstanding was 3.23 years.

7,802,579		

As at April 30, 2014, the weighted average remaining life of warrants outstanding was 1.63 years.

12. SHARE-BASED PAYMENT RESERVE

The share-based payment reserve records items recognized as share-based payments until such time that the stock options and finders' warrants are exercised, at which time the corresponding amount will be transferred to share capital. During the three months ended April 30, 2014 500,000 options at \$0.10 per share were exercised and the fair value of these options of \$25,463 was reclassified from share-based payment reserve to share capital.

13. FINANCIAL RISK AND CAPITAL MANAGEMENT

The Company is exposed in varying degrees to a variety of financial instrument related risks. The Board of Directors approves and monitors the risk management processes, inclusive of documented investment policies, counterparty limits, and controlling and reporting structures. The type of risk exposure and the way in which such exposure is managed is provided as follows:

Credit risk

Credit risk is the risk that one party to a financial instrument will fail to discharge an obligation and cause the other party to incur a financial loss. The Company's primary exposure to credit risk is on its cash held in bank accounts. The majority of cash is deposited in bank accounts held with major banks in Canada. As most of the Company's cash is held by two banks there is a concentration of credit risk. This risk is managed by using major banks that are high credit quality financial institutions as determined by rating agencies. The Company's secondary exposure to risk is on its receivables. This risk is minimal as receivables consist primarily of refundable government goods and services taxes.

13. FINANCIAL RISK AND CAPITAL MANAGEMENT

Liquidity risk

Liquidity risk is the risk that the Company will not be able to meet its financial obligations as they fall due. The Company has a planning and budgeting process in place to help determine the funds required to support the Company's normal operating requirements on an ongoing basis. The Company ensures that there are sufficient funds to meet its short-term business requirements, taking into account its anticipated cash flows from operations and its holdings of cash and cash equivalents.

Historically, the Company's sole source of funding has been the issuance of equity securities for cash, primarily through private placements. The Company's access to financing is always uncertain. There can be no assurance of continued access to significant equity funding. Liquidity risk is, therefore, assessed as high.

Foreign exchange risk

Foreign currency risk is the risk that a variation in exchange rates between the Canadian dollar and other foreign currencies will affect the Company's operations and financial results. The Company operates in Canada and is, therefore, not exposed to foreign exchange risk arising from transactions denominated in a foreign currency.

Interest rate risk

Interest rate risk is the risk that the fair value of future cash flows of a financial instrument will fluctuate because of changes in market interest rates. The Company has cash balances at April 30, 2014 and no-interest bearing debt, therefore, interest rate risk is nominal.

Capital management

The Company's policy is to maintain a strong capital base so as to maintain investor and creditor confidence and to sustain future development of the business. The capital structure of the Company consists of equity, comprising share capital, net of accumulated deficit.

There were no changes in the Company's approach to capital management during the year.

The Company is not subject to any externally imposed capital requirements.

Classification of financial instruments

Financial assets included in the statements of financial position are as follows:

	April 30, 2014	January 31, 2014
FVTPL:		
Cash and cash equivalents	\$ 2,206,010	\$ 1,655,703

Financial liabilities included in the statements of financial position are as follows:

	April 30, 2014	January 31, 2014
Non-derivative financial liabilities:		
Trade payables	\$ 281,993	\$ 58,303
Due to related parties	120,128	78,477
	\$ 402,121	\$ 136,780

13. FINANCIAL RISK MANAGEMENT (cont'd)

Fair value

The fair value of the Company's financial assets and liabilities approximates their carrying amount.

Financial instruments measured at fair value are classified into one of three levels in the fair value hierarchy according to the relative reliability of the inputs used to estimate the fair values. The three levels of the fair value hierarchy are:

- Level 1 – Unadjusted quoted prices in active markets for identical assets or liabilities;
- Level 2 – Inputs other than quoted prices that are observable for the asset or liability either directly or indirectly; and
- Level 3 – Inputs that are not based on observable market data.

The following is an analysis of the Company's financial assets measured at fair value as at April 30, 2014 and January 31, 2014:

	As at April 30, 2014		
	Level 1	Level 2	Level 3
Cash and cash equivalents	\$ 2,206,010	\$ -	\$ -
	As at January 31, 2014		
	Level 1	Level 2	Level 3
Cash and cash equivalents	\$ 1,655,703	\$ -	\$ -

14. SUPPLEMENTAL CASH FLOW INFORMATION

During the three months ended April 30, 2014 and 2013 the Company incurred the following non-cash transactions that are not reflected in the statements of cash flows:

	Three months ended	
	April 30, 2014	April 30, 2013
Exploration expenditures included in trade payables and accrued liabilities	\$ 393,704	\$ 39,146
Fair value of shares issued for mineral property option payments	\$ 118,250	\$ 17,250
Fair value of finders' warrants	\$ 24,563	-
Fair value of stock options reallocated to share capital	\$ 22,484	-
Virginia shares received	-	\$ 200,000

15. SUBSEQUENT EVENTS

- a) The Company granted 500,000 stock options to an investor relations consultant that can be exercised at \$0.61 per share until May 5, 2019.

TERRAX MINERALS INC.

MANAGEMENT'S DISCUSSION AND ANALYSIS OF FINANCIAL CONDITION AND RESULTS OF OPERATIONS

For the three months ended April 30, 2014

This Management Discussion and Analysis of TerraX Minerals Inc. ("TERRAX" or the "Company") provides analysis of the Company's financial results for the three months ended April 30, 2014 and should be read in conjunction with the accompanying unaudited condensed interim financial statements and notes thereto for the three months ended April 30, 2014 and with the audited financial statements and notes thereto for the year ended January 31, 2014, all of which are available at www.sedar.com. This discussion is based on information available as at June 27, 2014

The accompanying April 30, 2014 condensed interim financial statements have been prepared in accordance with International Financial Reporting Standards ("IFRS") applicable to the preparation of financial statements. All amounts are expressed in Canadian dollars, unless otherwise stated.

Certain statements made may constitute forward-looking statements. Such statements involve a number of known and unknown risks, uncertainties and other factors. Actual results, performance and achievements may be materially different from those expressed or implied by these forward-looking statements. Additional information about TerraX Minerals Inc. is available at www.sedar.com.

The Company was incorporated on August 1, 2007 pursuant to the provisions of the *Business Corporations Act* (British Columbia) under the name of TerraX Resource Corp. On March 31, 2008, the Corporation amended its notice of articles to change its name to TerraX Minerals Inc. The Company has no subsidiaries.

OVERVIEW

The principal business of the Company is the acquisition and exploration of mineral exploration properties in underexplored areas of Canada. The Company's current focus is the **Yellowknife City Gold Project**, which now comprises approximately 8,400 hectares of contiguous land immediately north of the City of Yellowknife in the Northwest Territories and includes TerraX's wholly-owned Northbelt property acquired in February 2013.

TerraX acquired a 100% interest in the Northbelt property in February, 2013. The property has no third party interest or payments, nor any retained NSR royalties, and consists of 121 leases totalling 8,802 acres (3,562 hectares) which cover approximately 13 km of strike along the prolific Yellowknife Belt. Northbelt is host to multiple shears that are the recognized hosts for gold deposits in the Yellowknife camp, including the past producing Giant (7.6 Moz) and Con (5.5 Moz) mines, and it contains innumerable gold showings. Known mineralization on the property contains free milling gold.

In addition TerraX has carried out a strategy of acquiring prospective ground adjacent to Northbelt and in October 2013 TerraX entered into an option agreement whereby it can acquire a 100% interest in the **Walsh Lake gold property**, which is contiguous with and immediately east of Northbelt. The Walsh Lake property consists of seven leases and five claims totalling 6,659 acres (2,695 hectares). TerraX has also staked ground to the west of Northbelt to cover prospective geology that is on strike from Northbelt structures. For more information on the Yellowknife City Gold Project, including the Northbelt, Walsh Lake and Goodwin properties, please visit our web site at www.terraxminerals.com.

TerraX also holds 100% interests in the **Blackfly** and **Central Canada gold** projects in the Marmion Batholith gold district near Atikokan, Ontario as well as the **Stewart copper-gold** property in Newfoundland.

The Blackfly gold property consists of five claims totalling 64 claim units (~10.1 km²) located within 15 km of Osisko Mining Corporation's (TSX: OSK) Hammond Reef gold deposit, which contains a National Instrument 43-

101 compliant Global Measured and Indicated resource of 196.4 Mt @ 0.86 g/t (5.43 Moz Au). Osisko Mining Corporation's technical report on the Hammond Reef property is available at www.sedar.com. The geology and known mineralization on the Blackfly property are similar to the Hammond Reef deposit and the Blackfly property appears to be along strike from Hammond Reef.

The Central Canada gold property consists of seven claims totaling 24 claim units (~3.8 km²) located 20 km east of the town of Atikokan, 160 km west of Thunder Bay and 19 km from the Hammond Reef deposit.

The Stewart copper-gold property consisted of two mineral exploration licenses, totalling 242 claims (~60.5 km²), located 30 km north-northeast of the town of Marystown, which is in turn approximately 300 km by road southwest of St. John's on the Burin Peninsula. The Stewart property is considered prospective for a large tonnage, low grade copper-gold porphyry deposit and/or a smaller high grade epithermal gold deposit.

NORTHBELT GOLD PROPERTY, NORTHWEST TERRITORIES

On February 13, 2013, the Company completed the acquisition of the Northbelt property in the Yellowknife area of the Northwest Territories, Canada and commenced a compilation of previous work. The property was explored at the beginning of the Yellowknife gold rush in the early 1940s. It was staked by multiple claimholders in 1944 with the discovery of the outcropping Crestaurum deposit. Drilling commenced in 1945 and the property was intermittently active throughout the 1960s and 1970s. By the 1970s Giant Gold Mines had largely consolidated the property and began serious exploration and by the end of the 1980s substantial drill programs were completed. Detailed mapping during this period confirmed that the property hosts the extension of the Yellowknife Gold Camp's gold bearing structures and that the stratigraphy associated with the large mines occurs in the southern part of the property. It was also realized that numerous other sub-parallel structures host gold occurrences, including the Crestaurum deposit. In addition, a precious metal enriched base metal (Zn/Pb +/-Cu) play was identified in the northern part of the property. At least 450 drill holes were completed on the property between 1938 and 1996, mostly concentrated on the Crestaurum deposit (approximately 200 holes).

HISTORICAL WORK

Crestaurum Deposit

The Crestaurum deposit is contained within a shear that trends for at least 1.5 km in a northeast direction. On the order of 200 drill holes intersect the mineralized structure, with the vast majority intersecting the structure at less than 100 m vertical depth. The shoots best defined by drilling (North, Central, and South in the No. 1 Shear) consist of narrow veins, generally less than 1 m thick, within a chloritic (+/- carbonate and sericite) shear that can be up to 25 m wide. Sampling of the historical drilling was mostly confined to the veins, although some holes were more comprehensively sampled and show a wide zone of anomalous mineralization across the shear structure and into wallrocks. The Crestaurum shear bifurcates at its northern end and both horizons have high grade gold intersections. The No. 1 shear is the only one with previous resource estimates.

During the due diligence studies, TerraX reviewed a listing of 169 holes used in the resource calculation prepared by D.W. Lewis for Giant Mines Ltd. in 1985 that estimated a resource of 572,040 tonnes at 6.72 g/t Au (123,489 ounces). Of these holes, 133 had high grade gold intersections, and several were mineralized on two or more shears. Visible gold was common, with 44 holes reporting coarse gold. A selection of some of the higher grade and wider intersections includes:

Hole	From (m)	to (m)	Interval (m)	Au g/t
8	32.82	36.07	3.25	11.65
31	44.68	46.05	1.37	477.66
32	34.49	40.54	6.05	7.78
150	52.94	57.58	4.64	24.60
166	126.03	132.34	6.31	10.72

The Crestaurum deposit was subjected to numerous resource calculations over the years, and to preliminary mine planning by Giant Mines, but its development was largely thwarted by the fact that the free milling gold, similar to Con's Campbell Shear ore, was detrimental to the roasting process used at Giant for its refractory ore. A 1985 metallurgical study based on several drill holes representative of the mineralization and composited into two metallurgical samples reported poor recoveries using the Giant Mine's roasting process (44-62% recovery of gold), but further testing by conventional cyanidation led to the conclusion that "both composite samples were determined to be free milling and best suited for a straight cyanidation process", and that this process would "yield recoveries in the order of 95%". It was also determined during the metallurgical tests that gold head grades were 15% higher than uncut grades estimated from drill sample assays.

TerraX believes the historic resources and the metallurgical testing are relevant but investors are cautioned that the estimates were prepared before the introduction of National Instrument 43-101 Standards of Disclosure for Mineral Projects. A Qualified Person has not completed sufficient exploration work nor conducted an examination of past work to define a resource that is currently compliant with NI 43-101. It is important to note that these calculations relied on sampling procedures that concentrated on quartz vein material and most holes were not sampled throughout the much broader lower grade shear zones hosting the veins. It is TerraX's belief, after reviewing historic drill logs, that the resource would be significantly expanded by including all intercepts greater than 1 g/t Au. In addition, the Crestaurum historical resource calculation is restricted to the No. 1 Shear, and modelled mineralized blocks had a limited strike length. Subsequent drilling has confirmed substantial strike and depth expansion of the zones.

Other Targets

The final significant work on the property was conducted in the first half of the 1990s with work focused on other shear zones (25 gold bearing shears identified in the southern part of the property), and on the southern and northern extensions to the Crestaurum deposit. Significant success was achieved in deeper drilling (up to 300 m below surface) on the northern extension of the Crestaurum, and on what is interpreted as the extension of the main Giant Mine trend.

Beyond the known historical resources at Crestaurum, several drill holes have been drilled over the years to evaluate the extensions to the shears, most importantly to the north where the Crestaurum Shear is intersected by several other shears, including the **20 Shear**, the **20 West Splay** and the **19 Shear** (see the map on the TerraX web site). Drilling in the area in 1995 and 1996 had considerable success in intersecting high grade and wider zones of mineralization, as well as multiple horizons of gold, with some holes reporting up to five significant intersections. Particularly wide intersections occur in some deeper holes, indicating the potential for substantial increases in the size of the Crestaurum zones. These include:

Hole	From (m)	to (m)	Interval (m)	Au g/t
NB-95-3	109.06	110.09	1.03	102.91
NB-96-02	319.58	338.36	18.78	4.74
incl.	320.95	331.01	10.06	8.39
NB-96-16	337.26	347.01	9.75	8.76

The 20 Shear was a well recognized target early in the exploration of Northbelt and there has been considerable success in drilling gold mineralization as this shear began to intersect the Crestaurum structure, possibly creating a classic dilation along orthogonally intersecting structures. A very significant drill intersection on this structure was drilled and reported by Nebex Resources Ltd. in 1994 (Hole NB-94-1A).

Hole	From (m)	to (m)	Interval (m)	Au g/t
NB-94-1A	285.37	305.58	19.71	4.61

In the northern part of the property there is widespread VMS style mineralization. As with the gold targets it was

initially found on surface and later explored with drilling. Subsequent drill holes under these showings seem to show relatively good continuity, even of the narrow lenses. The horizons are Pb-Zn rich, with minor Cu, very high silver content and locally appreciable gold. Examples include:

Hole	From (m)	to (m)	Interval (m)	Au g/t	Ag g/t	Zn%	Pb%	Cu%
G2	72.24	74.68	2.44	0.69	162.14	7.64	9.95	0.25
38-2	42.06	48.16	6.10	2.54	204.31	10.82	6.03	0.55

SURFACE EXPLORATION AND GEOPHYSICAL SURVEY

Access and logistics for the project are excellent and field work began in early June 2013 following the compilation of information collected during two work sessions in Yellowknife in January and February. A GIS project has been created to direct 2013 field work, with a digital drill database having been constructed from historical holes for 3D modeling of mineralized bodies.

Terrax commenced exploration at Northbelt May 30, 2013 with an airborne survey to acquire detailed magnetic, electromagnetic (EM) and radiometric data. This survey was completed in the first week of June.

The shears that control gold mineralization on the property are thought to have higher magnetic signatures than the surrounding rocks, and therefore the detailed magnetics should be an effective targeting tool. In addition, the alteration associated with gold mineralization has been shown to have a potassic component which can be picked up by the radiometric survey. Together, magnetic and radiometric data should be helpful in targeting the best portions of the mineralized shears.

The EM survey was designed to identify anomalies associated with any volcanogenic massive sulphide deposits that occur in the north of the property. Initial site reconnaissance carried out earlier in May on outcrop exposures of Zn-Pb-Cu-Ag-Au massive sulphide zones indicates they have sufficient thickness and strike continuity for EM response.

The airborne geophysical survey was conducted by Aeroquest Ltd. of Aurora, Ontario. The survey was flown by helicopter at a height of between 30 m and 60 m and consisted of a total of 520 line km, comprised of east-west lines spaced 100 m apart, and two north-south tie lines 3 km apart. The magnetic survey revealed a major magnetic high in the northern part of the property, as well as strong north-northeast anomaly orientations interpreted to be caused by both stratigraphy and structures. The radiometric count-per-second (CPS) data for potassium showed highs corresponding to granites, and several moderate strength north-northeast trending linear highs that could represent hydrothermal alteration along mineralized structures.

The EM survey revealed a 1.2 km long, north-trending conductor in the northern part of the property, 400 m of which is highly conductive. The source of this conductor is not apparent from surface examination, but numerous base metal occurrences are present in the general area (see below). A 4 km long, north-northeast trending intermittent conductor is present in the central part of the property, and an 800 m long conductor is present in the southern part of the property. Small amounts of graphitic sediments were noted in the central part of the property, and initial reconnaissance of the southern anomaly indicated that it likely has a structural association. Images of the geophysical data are provided on our website at www.terraxminerals.com.

TerraX's initial three week field program in June 2013 concentrated on locating historical drill collars in the field, preliminary surface sampling and first-pass examination of the airborne EM anomalies. In addition, TerraX was able to locate drill core from 176 holes drilled by prior operators.

Historical reports indicate that at least 463 drill holes have been drilled on the Northbelt property, including approximately 190 on the Crestaurum trend, 95 focused on other well defined structures in the southern part of the property, 80 on the base metal targets in the northern part of the property, and the remainder spread across the property. TerraX found the drill collar locations in the field for 123 of the Crestaurum holes, 29 of the 95 holes

focused on structures in the southern part, 39 of the 80 holes targeted on base metals, and 39 of the other holes on the property. Many of the historical collars that were not located were drilled from winter ice over lakes and ponds; their locations are known with a considerable degree of accuracy as they were drilled from the same surveyed ground grids as drill collars that were located onshore.

All drill hole locations were recorded with a hand-held GPS and 155 of the most important holes in the southern part of the property were subsequently surveyed with a differential GPS to <1 m accuracy by Ollerhead & Associates Ltd. of Yellowknife. Precise knowledge of the location of historical drill holes will allow TerraX to twin specific holes and also to create accurate 3-D models where drilling is sufficiently dense. In many drill holes casing has been left intact and capped, offering the option of carrying out downhole geophysical surveys and wedging directly from holes with mineralized intersections.

A substantial amount of historical core from the Northbelt property was stored at a storage facility on the Giant mine site. Approximately 30 holes from the northern part of the property, drilled in 1973 and 1974, were recovered along with 86 holes drilled in the 1990's from the southern part of the property. Partial intervals (typically the ore intersections) from at least 60 Crestaurum holes drilled in 1985 were also preserved. In July, TerraX moved five complete holes, the Crestaurum intersections and two pallets of core representing mineralized intersections from 1990's drilling to its new core facility established at the Yellowknife airport. One hole (NB95-16) was completely re-logged and re-sampled (66 samples) with assay results interpreted and released in August, 2013 (see below). The remainder of the Northbelt core at Giant was moved to our core facility during the fall of 2013. TerraX is in the process of re-logging, re-sampling and conducting extra sampling of the many drill hole cores discovered at the Giant mine site.

During June 2013 TerraX conducted preliminary examination and sampling of selected mineralized structures, with 300 surface samples (grabs and chip samples) collected. The structural regime of the property is dominated by north to north-northeast (000 to 030° trending), sub-vertical structures, with lesser north-northwest (typically 340°) structures. Structures observed on surface consist of 0.5 to 15 m wide zones of iron carbonate alteration, with or without sericite or chlorite. One or more quartz veins typically occur within the structure; such veins can be up to 1 m wide and have varying amounts of pyrite, arsenopyrite and base metal sulphides (galena, sphalerite, less commonly chalcopyrite). Bands of semi-massive sulphide up to 1 m wide are common in the northern part of the property and less common in the southern part. In all cases these bands are interpreted to be structurally controlled. Galena and sphalerite predominate in these bands; arsenopyrite is common and chalcopyrite less so.

On July 31 2013 TerraX announced the results of initial surface sampling. The sampling program comprised a total of 293 samples, including 165 chip samples from 80 separate locations and 128 grab samples. The majority of the sampling was from structures identified at the **Homer Lake** area in the northern part of the property, with sampling also conducted on the Pinto structure in the eastern part of the property, the **Jed structure** in the central part of the property, on the **southwestern extension of the Crestaurum deposit**, and in several other locations (see maps on our website at www.terraxminerals.com). Results ranged from below detection to assay values of **49.30 g/t Au and 55.2 g/t Ag** in one grab sample at Pinto and **529 g/t Ag, >20% Pb and 9.44% Zn** in one grab sample from Homer Lake (see Table 1 below).

The first round of surface sampling by TerraX on the Northbelt property has generated very encouraging results from a number of structures. As noted by previous workers, the northern part of the property contains more base metals and silver than gold, whereas the southern part is more gold-rich. However, notable gold values have been obtained in the northern part, and locally high base metals and silver have been observed in the southern part. The initial interpretation is that in spite of the difference in mineralization styles between the northern and southern parts of the property, the overall structural regime is similar throughout the property, with most of the mineralization occurring in north-northeast trending structures. It may be important that auriferous north-northwest trending structures were noted at both Crestaurum Southwest and Homer Lake; the intersection of the two structural trends could be very significant.

Homer Lake Area

Six mineralized structures, labelled Structure 1 to Structure 6, were delineated during reconnaissance prospecting in the Homer Lake area in the northern part of the Northbelt property. Five of these trend north-northeast and the sixth trends north-northwest. Numerous precious and base metal values were obtained from these structures; each structure has at least one sample with ≥ 2 g/t Au or ≥ 100 g/t Ag, or both, and four of the six have at least one sample with greater than 5% of both Pb and Zn (Table 1). Structure 2 is the most predominant structure. It has been traced for 1,200 m and has a best chip sample result of **7 m @ 0.50 g/t Au, 90.2 g/t Ag, 4.25% Pb and 0.89% Zn**. An intersection of **2.44 m @ 0.69 g/t Au, 162 g/t Ag, 9.95% Pb and 7.64% Zn** from hole G-2, drilled in 1973, is interpreted to be from this structure, as is an intersection of **3.35 m @ 0.49 g/t Au, 90.4 g/t Ag, 3.77% Pb and 1.35% Zn** from hole N92-1, drilled in 1992. Drill logs from historical holes suggest that a number of sulphide bearing structures exist which have not yet been recognized on surface by TerraX. The significant EM anomaly identified by TerraX's airborne geophysical survey occurs in the Homer Lake area, but none of the known mineralized structures are interpreted as the cause of the anomaly.

Pinto Area

The Pinto area in the southeast part of the property consists of at least three subparallel north-northeast trending structures. The northernmost, Pinto #1, is a 1 m wide quartz vein with local galena and chalcopyrite, surrounded by iron carbonate alteration. The structure is exposed in a series of trenches and pits over a strike length of 120 m. Grab samples from this vein returned the two highest gold assays from TerraX's sampling program, **49.3 and 38.5 g/t**, and a chip sample assayed **2 m @ 7.15 g/t Au, 5.6 g/t Ag, 0.23% Pb and 0.20% Zn**. The Pinto South zone (also called AES), 1.5 km south of Pinto #1, likewise consists of quartz veins and iron carbonate alteration in a structure exposed in trenches and veins over a 300 m strike length. Gold grades up to **12.85 g/t** were obtained from this zone, and a chip sample ran **1 m @ 4.76 g/t Au, 0.6 g/t Ag and 0.13% Zn**. Importantly, neither zone has been drill tested. An intervening structure was followed for 150 m along strike but only returned a high of 150 ppb Au.

Jed Structure

The north-northeast trending Jed structure was sampled by TerraX over a strike length of 600 m. The best chip sample results were **1.40 m @ 16.85 g/t Au, 23.7 g/t Ag and 0.20% Pb** in the northern part and **3.40 m @ 2.12 g/t Au and 19.3 g/t Ag** in the southern part. Historical drilling by the Con Mine in the 1940's confirms that the structure has a minimum strike length of 1,700 m, and is gold bearing over its entire length. The higher grade northern vein exposure trends into a lake and the vein can be seen to extend for at least 20 m further north under the water.

Crestaurum Southwest

Sampling was also completed on the southwestern extension of the structure that hosts the Crestaurum deposit. This northeast trending structure was sampled in three locations over a 200 m strike length, yielding a best chip sample result of **3 m @ 15.24 g/t Au, 3.9 g/t Ag, 0.44% Pb and 0.08% Zn**, as well as a grab sample with **5.36 g/t Au, 43.2 g/t Ag, 3.11% Pb and 10.6% Zn**. The main structure is cut by a number of northwest trending (340°) structures. One of these was sampled over a strike length of 80 m, producing a chip sample of **1 m @ 8.51 g/t Au and 0.3 g/t Ag**, and a best grab sample result of **21.0 g/t Au and 0.3 g/t Ag**. The intersection of the main northeast trending Crestaurum structure with the numerous northwest structures could provide a control on the interpreted high grade lodes defined in historical resource estimates made at Crestaurum.

Table 1: Selected Assay Results from June 2013 Sampling of Northbelt Property

Area	Type	Length	Au (g/t)	Ag (g/t)	Pb (%)	Zn (%)

-----------	------	--------	------	-----	--	--

A second field prospecting program was carried out in September, and results were reported on November 6, 2013. The September exploration program followed up specific anomalous areas delineated during the June 2013 surface sampling campaign and also involved sampling in new areas. A total of 327 separate grab and chip samples were collected from the property, mostly from mineralized showings and historical trenches. New mineralized structures sampled/identified during the fall program included the Island Lake Shear and southwestern extension of the Crestaurum deposit in the southern part of the property, AES in the eastern part, Shear 19 and Shear 20 in the central part, Likely Lake in the north and Ryan Lake to the west. Follow-up sampling on known structures expanded the strike length at the Homer Lake area in the north; the Pinto structure in the eastern part of the property, and the Barney and Jed structures in the central part of the property. Results ranged from below detection to assay values of (different samples) **145 g/t Au, 170 g/t Ag, 11.25% Pb, 6.41% Zn and 0.85% Mo**. Highlights of the assay results are provided in the table below; assay results from the June and September campaigns have been combined and are shown on maps available on our website at www.terraxminerals.com.

The second round of surface sampling by TerraX on the Northbelt property has generated very encouraging results from a number of structures and expanded TerraX's knowledge of the distribution of mineralization on the property. As noted by previous operators, the northern part of the property contains more base metals and silver than gold, whereas the southern part is more gold-rich. However, notable gold values have been obtained in the northern part, and locally high base metals and silver have been observed in the southern part. Initial examination of the area proximal to the Ryan Lake granite suggests that the property may also host porphyry style mineralization.

Crestaurum Southwest and Island Lake Shear

A trench along the southwestern extension of the structure that hosts the Crestaurum deposit was re-examined in September, when it contained less water. **Visible gold** was noted at this time. It was possible to extend the chip sampling in this trench by 1 m; the new sample ran **1 m @ 51.3 g/t Au and 1.9 g/t Ag**. When combined with the June results, this trench yielded **4 m @ 24.26 g/t Au and 3.4 g/t Ag**. Additional grab sampling from the trench produced results of **145.0 and 97.2 g/t Au**.

The east-northeast trending Island Lake Shear occurs 250 m southwest of the Crestaurum SW trenches. Sampling along this shear and cross-cutting quartz veins over a strike length of 110 m resulted in a chip sample of **1 m @ 27.9 g/t Au and 3.1 g/t Ag**, as well as grab samples of **39.3 g/t Au and 27.5 g/t Au**.

Pinto and AES Area

Pinto grab and chip sampling from small pits added 50 m to the known surface expression of the Pinto vein in the east part of the property; anomalous gold has now been found over a strike length of 155 m. The best new result is a grab sample of **20.20 g/t Au, 7.4 g/t Ag and 0.24% Pb**; the best overall result from both campaigns is a grab sample of **49.30 g/t Au, 55.2 g/t Ag, 4.37% Pb, 2.01% Zn, and 0.5% Cu**. The Pinto vein strikes into areas of no outcrop to the northeast and southwest.

The AES structure is subparallel to the Pinto vein and 1.5 km to the south. Samples collected in June over a restricted portion of the structure returned values including **12.85 g/t Au** (grab sample) and **4.76 g/t Au** (1 m chip sample). Sampling in September revealed that anomalous gold occurs within the structure over a strike length of at least 1.1 km, including the intersection of the AES structure with the Barney Shear. New values associated with this structure include grab samples of **2.80, 4.92 and 7.52 g/t Au**, and chip samples of **1 m @ 2.30 g/t Au and 0.43% Zn** and **1 m @ 2.53 g/t Au**.

Barney Shear

The north-trending Barney Shear has been traced by previous workers over a strike length of 4.5 km and drill tested over 600 m of strike length. A number of high-grade gold results were reported in drilling, mostly beneath Milner Lake. In September, TerraX prospected the length of the Barney Shear, collecting 109 grab and chip samples.

Almost half of these samples were anomalous in gold (>50 ppb) and six of the grab samples contained more than 1 g/t Au, with a high of **12.30 g/t**. The shear contains anomalous base metals throughout its length, with high values of **5.77% Pb, 6.41% Zn and 0.75% Cu** (different samples). Thirteen samples contained more than 1% Pb and five contained more than 1% Zn. The most consistent mineralization occurs proximal to intersections of the Barney Shear with northeast-trending shears.

Jed and Shear 19 Structures

The north-northeast trending Jed structure was sampled in June over a strike length of 600 m. The best chip sample results were **1.40 m @ 16.85 g/t Au, 23.7 g/t Ag and 0.20% Pb** in the northern part and **3.40 m @ 2.12 g/t Au and 19.3 g/t Ag** in the southern part. Six additional grab and chip infill samples were collected in September, including two grab samples which ran **10.60 g/t Au and 5.5 g/t Ag**, and **9.6 g/t Au and 34.1 g/t Ag**.

TerraX sampled Shear 19, subparallel to and 150 m to the east of Jed, in September. Thirteen grab and chip samples were collected, indicating mineralization over a strike length of at least 150 m. High values of **5.53 g/t Au, 135 g/t Ag, 1.13% Pb and 0.96% Zn** (different grab samples) were returned.

Shear 20 and West Splay Structures

TerraX collected 18 grab samples along the 1.5 km strike length of the 20 Shear and associated West Splay. Historical drill hole NB94-1A, drilled across the northern part of these structures in 1994, was re-assayed by TerraX and produced an intersection of **21.12 m @ 2.97 g/t Au** (news release, October 16, 2013). The only sample TerraX took proximal to this intersection ran **13.60 g/t Au**; other TerraX samples collected in the southern part of the structures were low grade to non-anomalous.

Homer Lake/Likely Lake Area

Twenty-five grab samples were taken from the immediate Homer Lake area, where six mineralized structures (five trending NE and one trending NW) were defined in the June exploration campaign, with chip sampling results that included **7 m @ 0.50 g/t Au, 90.2 g/t Ag, 4.25% Pb and 0.89% Zn**. Recent samples contained up to **2.25 g/t Au, 159 g/t Ag, 11.25% Pb and 1.49% Zn** (different samples). These samples variably expanded the known strike length of the main structures and indicated that several minor structures are also mineralized.

Sixteen grab and chip samples were collected from the Likely Lake area of mineralization, approximately 500 m southwest of the Homer Lake mineralization. North-northeast trending structures present at Likely Lake are probably extensions of the structures seen at Homer Lake. A grab sample collected in June ran **7.54 g/t Au, 269 g/t Ag, 0.48% Cu and 1.1% Pb**. One September chip sample ran **1 m @ 1.69 g/t Au, 138 g/t Ag and 0.89% Pb**, and one grab sample returned values of **5.18 g/t Au, 27.4 g/t Ag and 0.17% Pb**.

Ryan Lake Area

The Ryan Lake area is interesting because it occurs on the eastern margin of the Ryan Lake granite. Numerous thin quartz veins, some with apparent potassium feldspar, occur near the margins of the granite and pyrite is abundant. A 0.5 to 2 m wide, north-northwest trending vein occurs within the granite, and was sampled by TerraX over a strike length of 475 m. This vein does not carry appreciable gold, but one grab sample assayed **0.85% Mo**, and a chip sample ran **1 m @ 0.25% Mo**. These results suggest the presence of a possible porphyry style mineralization system that should be investigated further. A west-northwest trending 1 m wide quartz vein occurs in the volcanic stratigraphy immediately east of the granite; this vein can be traced for at least 150 m, and has returned grab samples with up to **3.15 g/t Au and 170 g/t Ag** (different samples).

Selected Assay Results from TerraX's September 2013 Surface Sampling, Northbelt Property

TerraX has collected a total of 620 grab and chip samples to date on the Northbelt property. Numerous anomalous to ore grade metal (Au, Ag, Pb, Zn, Mo, Cu) results have been obtained, and many areas of interest, i.e. potential drill targets, have been delineated. In spite of this, at least eight mineralized trends defined by previous workers

have not been examined by TerraX, and over half the property has been examined only superficially by previous companies and not at all by TerraX. The likelihood of discovering additional mineralization on surface in the future is thus considered high.

DRILL HOLE RE-LOGGING AND RE-ASSAYING

Barney Lake Shear Corridor

The first hole submitted for re-assay, NB95-16, was drilled on the Barney Shear by Nebex Resources Ltd. in 1995. Results were reported in August 2013 and included an interval of **20.86 m @ 3.79 g/t Au, inclusive of 4.00 m @ 12.59 g/t Au.**

TerraX had previously discovered drill logs with hand written assay results, and TerraX had the hole collar location of NB95-16 surveyed along with 154 other drill holes in June of this year. Hole NB95-16 has a capped casing which will allow re-entry into this hole to follow-up on the known mineralization. The ready accessibility of 100% of the core from NB95-16, with the exception of 94 cm of high grade core which was taken as display core in 1995, coupled with the known hole collar location, the recorded hole orientation and downhole surveys, and the written annotations and assay values that indicated that NB95-16 had discovered a new zone of mineralization, made NB95-16 the first choice to be re-logged and re-sampled.

The core was subjected to a full geological and geotechnical analysis which included refitting of the core, revealing excellent 100% recovery and excellent geotechnical rock quality values. Core distances were converted from the original imperial measurements (feet) to metric (meters), and new core sampling intervals designated from the metric measurements. Logging of NB95-16 revealed an extensive zone of alteration (siliceous, carbonate, sericitic, +/- chlorite) and shearing from 265 m to the end of the hole at 408 m. Within this wide zone of alteration were several zones of quartz veining and mineralization (pyrite, arsenopyrite, galena, sphalerite, chalcopyrite and stibnite), with an area of concentrated mineralization and veining from 334.06 to 362.38 m.

TerraX collected 66 samples for assay from hole NB95-16. Results ranged from below detection to a high of 38.1 g/t Au. Best results were obtained between 334 and 362 meters, but anomalous values (0.1-1.18 g/t Au) occur in several other intervals. Sampling by TerraX over the interval from 333.56 to 362.88 m was done by quarter core sampling with a diamond saw of the half sawn core remaining from previous sampling. A quarter core sample remains in the core boxes for further examination if required.

TerraX believes the results of the assaying were excellent confirmation of this important zone of mineralization, especially considering the exclusion of 94 cm of the richest core which was taken in 1995 as display core and therefore was not available for sampling by TerraX. Significant assay results include:

NB95-16 Assay Results					
	From (m)	To (m)	Interval (m)	Au (g/t)	Ag (g/t)
Total Zone	334.06	362.38	28.32	2.94	13.11
including	337.00	357.86	20.86	3.79	17.13
including	337.00	348.00	11.00	6.11	28.23
including	337.00	341.00	4.00	12.59	64.63

True thickness of this zone is unknown at present, but based on shear foliations (70-75° to core axis) it is believed that the intersections are 90-95% true width. Depth from surface for this intersection is approximately 240 vertical meters.

The assay results from NB95-16 hole confirm the important potential of the Barney Lake Shear Corridor, which is widely recognized in industry publications and historic reports to be the northern continuation of the gold mineralized shear system that hosted the past-producing Con (5.5 Moz) and Giant (7.6 Moz) gold mines in Yellowknife. The Barney Shear has been delineated by previous workers over a strike length of 4.5 km, and has been drill tested over 600 m of strike length. As follow-up, TerraX re-logged and re-sampled drill holes NB96-04

and NB96-02, both of which were drilled by Nebex Resources Ltd. in 1996 to continue testing the Barney Lake Shear Corridor. Assays were interpreted and released in November, 2013

Hole NB96-04 was drilled 60 m north of hole NB95-16 and is interpreted by TerraX to transect the same zone as NB95-16. Hole NB96-04 intersected **1.90 g/t over 27.00 m, including 8.97 g/t Au over 2.70 m**. In addition to the main zone of mineralization NB96-04 intersected other lower grade zones of mineralization above the main zone, including anomalous silver, copper and lead mineralization. There are no drill holes further north into the Barney Shear and the surface expression of this zone has been followed on surface for a further 700 m north of NB96-04. In addition, no holes were drilled up or down dip of NB96-04 or NB95-16. Both hole collars are in place and capped allowing for re-entry into these holes.

Hole NB96-02 is also within the Barney Lake Shear Corridor and is interpreted to intersect a closely parallel zone of mineralization to the Barney Shear. NB96-02 was collared 450 m west of NB95-16 and assayed **5.06 g/t Au over 8.16 m**. This higher grade mineralized zone was sampled to 328.33 m down hole where two boxes of core are missing (assumed to be removed in 1996 for display). The missing core extends from 328.33 m to 340.98 m. Historical assays from 1996 indicated the entire zone was **20.06 m @ 4.45 g/t Au**. The core remaining to TerraX was strongly mineralized to the end of the available core with the last sample interval grading **10.20 g/t Au over 0.64 m**, suggesting the missing core would also be mineralized.

TerraX collected 28 samples for assay from NB96-02 and 187 samples for assay from NB96-04. Results ranged from below detection to a high of 38.6 g/t Au. Best results were obtained between 320 and 328 meters down hole in NB96-02 and 399 and 426 meters down hole in NB96-04. Both holes contained sporadic anomalous values in several other narrow intervals. Sampling over several intervals, including the main zone, was done by quarter core sampling of half sawn core that remained from previous sampling in 1996.

Significant assay results include:

Drill Hole	From (m)	To (m)	Width (m)	Au g/t	Ag g/t	Cu%	Pb%
NB96-02	320.17	328.33	8.16	5.06	6.32	-	-
NB96-04	318.00	335.50	17.50	0.31	13.80	0.03	0.55
incl	325.75	329.50	3.75	0.86	23.80	0.14	0.95
	357.00	363.00	6.00	0.73	20.00	-	0.23
	399.00	426.00	27.00	1.90	6.94	-	0.11
incl	399.00	401.70	2.70	8.97	8.06	-	0.22
incl	410.90	417.00	6.10	3.33	8.59	-	0.08

True thickness of the main zones of mineralization is unknown at present. A map showing the location of these drill holes on the Barney Lake Shear Corridor is available on our web site at www.terraxminerals.com.

The assay results from NB96-02 and NB96-04 are very encouraging as they confirm the strike continuation (4.5 km) and substantial areal extent of the Barney Lake Shear Corridor, which surface mapping conducted by TerraX in June and September 2013 indicates consists of multiple mineralized shears over a 200 m width.

As continued follow-up on the Barney Lake Shear Corridor, TerraX re-sampled drill hole NB96-24 which is approximately 200 meters south of NB95-16 along strike on this important structure. NB96-24 was the longest hole drilled on the Northbelt property (+ 630 m) and intersected seven separate zones of mineralization in mafic volcanics, including gold, silver, copper and lead, and then intersected highly altered and mineralized porphyry to the end of the hole hosting gold silver, copper and molybdenum mineralization. The highest grade zones occurred in the porphyry (**4.00 m @ 7.73 g/t Au, 6.8 g/t Ag, 0.13% Mo and 2.00 m @ 7.44 g/t Au, 14.5 g/t Ag and 0.24% Cu**), and the widest zones in the volcanics (**72.00 m @ 0.43 g/t Au, 2.7 g/t Ag, 0.08% Cu**). The hole was terminated in mineralization.

Hole NB96-24 was collared in largely unaltered and massive to pillowed volcanics 200 m south of hole NB95-16 on the Barney Zone. At 188 m down hole the volcanics become sheared, and at 287 m alteration and visible mineralization (pyrite, arsenopyrite, chalcopyrite, galena, pyrrhotite, sphalerite, stibnite) become pervasive at low levels (1-3% combined sulphides) with significant zones of higher concentration (locally >10% combined sulphides) down to 588 m in the hole. From 588 m to the end of the hole at 674 m, NB96-24 intersected altered and mineralized granodiorite porphyry with feldspar altered to grey clay and amphiboles replaced by carbonate. Mineralization consists of quartz veins with pyrite, chalcopyrite, molybdenite, pyrrhotite and galena. The final 42 m of core from the bottom of the hole was jumbled and disorganized, so was not sampled, although visible alteration and mineralization continued to the end of the hole. Based on the high-grade values from the last 2.00 m of core that we were able to sample (**2.00 m @ 7.44 g/t Au, 14.5 g/t Ag, 0.24% Cu**), re-assembly and analysis of this final 42 m of core has become a high priority.

TerraX considers the results from NB96-24 highly significant as they indicate a new style of mineralization on the Northbelt property (porphyry gold, silver, copper, molybdenum). The potential of this style of mineralization is further enhanced by the fact that TerraX has sampled on surface what appears to be porphyry style mineralization two km to the west of the Barney Lake Shear Corridor within and adjacent to the Ryan Lake granodiorite intrusion. Grab samples of vein material at Ryan Lake assayed up to **3.15 g/t Au, 170 g/t Ag and 0.85% Mo**. Together, these occurrences indicate the potential for a very large mineralized plumbing zone in the Barney Lake Shear Corridor. Historical reports from the Con Mine at Yellowknife indicated similar porphyry mineralization proximal to the Con gold shear zones, and this commonality between the two areas is further encouragement that the Barney Lake Corridor has the potential to host a large gold deposit.

TerraX collected 282 samples for assay from NB96-24. Results ranged from below detection to a high of 28.6 g/t Au. Sampling over several intervals was done by quarter core sampling of half sawn core that remained from previous sampling in 1996. Significant assay results include:

Drill Hole	From m)	To (m)	Width m)	Au g/t	Ag g/t	Cu%	Pb%	Mo%	Rock Type

*Interval includes 5.61m of un-sampled core which was given a zero grade.

True thickness of the zones of mineralization is unknown at present. An updated map showing the location of NB96-24 and the other drill holes assayed to date on the Barney Lake Shear Corridor is available on our web site at www.terraxminerals.com.

Crestaurum

In February, 2013 TerraX discovered 187 drill logs for holes drilled between 1945 and 1985 on the Crestaurum deposit. These logs contain hand written assay results (no assay certificates are available) which indicated a significantly gold rich shear zone. In June TerraX located 123 drill collars at Crestaurum and had the locations surveyed. This included almost all of the 74 holes drilled in 1985, making the discovered drill core from these 74 holes a high priority choice to be re-logged and re-sampled. TerraX re-logged and re-sampled mineralized core intervals from the 74 holes drilled in 1985 at Crestaurum by Giant Mines to assist them in open pit and underground planning on the Crestaurum deposit.

The core recovered from these 74 holes included most of the mineralized drill core intervals (exceptions noted in table below). Core distances were converted from the original imperial measurements (feet) to metric (meters), and then it was subjected to geological re-logging. New core sampling intervals were designated from the metric measurements based on observed mineralization, but by and large consisted of standard 1 meter sample intervals. Compared to the size of other shears on the property, the logging revealed a relatively narrow zone of alteration (siliceous, carbonate, sericitic, +/- chlorite) and shearing with many holes displaying quartz veining and mineralization (pyrite, arsenopyrite, galena, sphalerite, chalcopyrite and stibnite). Several drill holes displayed visible gold as fine grained aggregates or millimeter scale grains, generally within quartz, but occasionally seen in sheared host rock.

The results from the first 36 holes submitted for re-assay were announced on September 18, 2013. These holes had been drilled at the North Shoot of the Crestaurum deposit, and intercepted high-grade gold near surface in several holes. To the best of our knowledge, the assay results from these holes have never been reported by prior operators. Highlights included:

- **13.07 g/t Au over 6.87 meters** in hole 85-118
- **67.69 g/t Au over 2.00 meters** in hole 85-136;
- **11.96 g/t Au over 6.00 meters** in hole 85-166; and
- **13.45 g/t Au over 3.00 meters** in hole 95-134.

The 'North Shoot' is an area of higher grade mineralization on the Crestaurum shear that received almost half of Giant Mines' drilling effort in 1985. It is adjacent to an exploratory shaft sunk in 1946 to a depth of 400' (122m) and was subjected to mine planning and metallurgical testing by Giant Mines in the 1985 to 1988 period.

All holes from the North Shoot area are listed in the following table and are categorized into "Inside Shoot" and "Outside Shoot" based on interpretations of the zones done by Giant Mines in 1988. The table includes comment on issues concerning a few holes with missing core in the mineralized zones, and comment on spatial location of holes outside the shoot.

Assay Intervals from Crestaurum

Inside North Shoot

Orientation of the Crestaurum Zone is well defined by 187 drill holes (average 035° strike and average 50° dip), and therefore it is confidently known that the drill intersections are close to true thickness, ranging from 85%-100% true width.

TerraX collected 358 samples for assay from the drilling in the North Shoot area. Individual assay results ranged from below detection to a high of 131 g/t Au. Best results were obtained in areas of good quartz veining. Sampling generally was done by quarter core sampling of half sawn core that remained from previous sampling in 1985, although TerraX sampled all of the core that was available, and extended its sampling beyond the previous sample limits. In areas of previous sampling, quarter core samples remain in the core boxes for further examination if required. Newly sampled areas have one half core remaining.

TerraX re-logged and re-sampled mineralized core intervals from 38 more holes drilled in 1985 by Giant Mines on the Crestaurum deposit. These include holes from the North Extension Shoot area (16 holes), the Central Shoot area (11 holes), and the South Shoot area (11 holes). The results from the 22 holes drilled at the Central and South Shoots were reported on September 25, 2013, with high-grade gold intercepted near surface in several holes. Highlights include:

Central Shoot

- **20.66 g/t Au over 5.00 meters** in hole 85-187
- **12.79 g/t Au over 3.00 meters** in hole 85-181

South Shoot

- **12.43 g/t Au over 5.00 meters** in hole 85-173
- **8.03 g/t Au over 5.00 meters** in hole 85-174

The Central Shoot is 150 m south of the 36 drill intersections reported from the North Shoot on September 18, 2013. The South Shoot is a further 300 m southwest of the Central Shoot and is the most southerly area previously drilled on the Crestaurum shear.

All holes from the Central Shoot and the South Shoot areas are listed below and are categorized into “Inside Shoot” and “Outside Shoot” based on interpretations of the zones done by Giant Mines in 1988. The table includes comment on issues concerning a few holes with missing core in the mineralized zones, and comment on spatial location of holes outside the shoot.

TerraX collected 319 samples for assay from the drilling in the Central Shoot and South Shoot areas. Individual assay results ranged from below detection to a high of 85.6 g/t Au. Best results were obtained in areas of good quartz veining.

TerraX released their re-sampling results from the 16 holes drilled in 1985 by Giant Mines on the North Extension Shoot area of the Crestaurum deposit on October 2, 2013. The North Extension Shoot is 100 m north of the 'North Shoot', and is the most northerly area previously drilled on the Crestaurum shear. Highlights include:

- **62.90 g/t Au over 5.00 meters** in hole 85-150;
- **4.43 g/t Au over 5.00 meters** in hole 85-148; and
- **6.55 g/t Au over 2.00 meters** in hole 85-151

TerraX believes these assay results provide further confirmation of this important zone of mineralization at Crestaurum, which remains open in all directions and down dip. All holes from the North Shoot Extension area are

listed below and are categorized into “Inside Shoot” and “Outside Shoot” based on interpretations of the zones done by Giant Mines in 1988.

DDH85-161		81.38	82.00	0.62	2.94	North of North-Ext Shoot

TerraX collected 170 samples for assay from the drilling in the North Shoot Extension area. Individual assay results ranged from below detection to a high of 216 g/t Au. Best results were obtained in areas of good quartz veining.

The shear structure containing the Crestaurum mineralization has been drilled for 1400 m of strike length, but the deepest known intersection into the mineralization is less than 150 m vertical depth. The deposit is interpreted to extend further north than the North Extension based on widely spaced drilling with significant gold grades reported in drill logs by previous operators. It has almost no drilling to the south of the South Shoot. The deposit therefore remains open in all directions.

20 Shear

On October 16, 2013 TerraX announced results from the re-sampling of Hole NB94-01A at Northbelt. Hole NB94-01A was drilled on a third mineralized structure, the 20 Shear, located approximately 700 meters east of the

Crestaurum Zone and approximately 2000 meters southwest of the drilling reported on the Barney Shear. The 20 Shear strikes north-south, sub-parallel to the Barney Shear. It intersected a mineralized zone totaling **21.12 m @ 2.97 g/t Au, inclusive of 3.88 m @ 8.81 g/t Au.** The results from NB94-01A provide drill assay confirmation of a 3rd gold mineralized shear structure on the Northbelt property. Previous mapping of this structure has extended it for at least 4 km on surface and also identified additional gold mineralized splays and intersections associated with the 20 Shear.

The core was subjected to a full geological and geotechnical analysis which included refitting of the core, revealing 100% recovery and excellent geotechnical rock quality values. Core distances were converted from the original imperial measurements (feet) to metric (meters), and new core sampling intervals designated from the metric measurements. Logging of NB94-01A revealed extensive zones of alteration (siliceous, carbonate, sericitic, +/- chlorite) and shearing from 118 meters to the end of the hole at 325 meters. Within this wide zone of alteration were several zones of quartz veining and pyrite mineralization, with an area of concentrated mineralization and veining from 285.00-307.00 meters. This mineralization occurs in a siliceous rhyolitic tuff.

TerraX collected 64 samples for assay from NB94-01A. Results ranged from below detection to a high of 13.3 g/t Au. Best results were obtained between 285 and 307 meters down hole, with sporadic anomalous values (0.1-4.33 g/t Au) in several other narrow intervals. Significant assay results from hole NB94-01A include:

NB94-01A Assay Results				
	From (m)	To (m)	Interval (m)	Au (g/t)
Main Zone	285.88	307.00	21.12	2.97
including	289.86	303.96	14.10	4.07
including	300.14	303.96	3.88	8.81
Other Zones	118.08	119.33	1.25	1.11
	320.50	321.90	1.40	2.38

True thickness of the main zone is unknown at present and the depth from surface for this intersection is approximately 230 vertical meters.

The assay results from NB94-01A are very encouraging as they indicate another zone of important potential on the Northbelt property. The 20 Shear has been delineated by previous workers over a strike length of 4 km yet has had very little drill testing, with sporadic drilling over 200 m of strike length in 1994.

Logging and sampling of drill core recovered by Terrax from the Giant Mine site is ongoing, with core from approximately 200 holes now stored at our dedicated core storage facility at the Yellowknife airport.

Core sampling included insertion of certified standards and blanks. Samples were prepared at ALS Chemex's laboratory in Yellowknife and shipped to their Vancouver facility for gold and ICP analysis. ALS is a certified and accredited laboratory service.

In early March 2014 TerraX was issued a Land Use Permit (No. MV2014C005) from the McKenzie Valley Land and Water Board ("MVLWB") to conduct advanced exploration and drilling programs on its Yellowknife City Gold Project ("YCGP"). The permit has conditions applying to work activities typical for advanced exploration, and contains a condition for a security deposit of \$70,000 to be deposited with the minister of Aboriginal Affairs and Northern Development Canada. The permit is for a term of five years with the option of a two year extension. The term and area of the permit will allow TerraX to efficiently explore the YCGP in the years ahead.

The permit applies to all TerraX's exploration land holdings immediately north of the City of Yellowknife with the exception of the Goodwin Claims which contain approximately 5% of the YCGP area. At the request of the Yellowknife Dene First Nation (YKDFN"), TerraX requested that the Goodwin Claims not be included in the permit. This area is currently low priority for TerraX and the YKDFN has advised that portions of the Goodwin Claims border culturally and environmentally sensitive land. TerraX will conduct below threshold prospecting activity on the Goodwin Claims to ascertain their mineral potential and at that time will sit down with the YKDFN to advise them of findings prior to any future work on the Goodwin property.

The MVLWB received numerous letters of support from potentially impacted Aboriginal Communities, the City of Yellowknife and outdoor recreational groups which use the area together with constructive comments from a number of Government of the Northwest Territories (“GNWT”) and Federal Government reviewers. In preparation for the permit application the Company conducted over 400 community engagement activities since February 2013.

TerraX’s application had the potential to be complicated during the current implementation of legislation of devolution rights to manage lands and waters from the Federal Government to the Government of the NWT. TerraX wants to thank the Government of the NWT and the NWT Chamber of Mines for working together in the spirit of the NWT Mineral Strategy to coordinate and streamline the MVLWB permitting processes while respecting that the permitting process is focused on protecting the environment. The granting of this permit has confirmed TerraX’s faith in the NWT permitting process. The expeditious manner in which it was granted is a tribute to the initial direction TerraX received from MVLWB for constructing a comprehensive application, and to the robustness of the permitting process within the NWT.

Joe Campbell President and CEO of TerraX said: “TerraX thanks the MVLWB for their timely, professional and balanced approach to reviewing our Land Use Permit application. I personally want to thank all those who took the time during the last year to consult with us and to submit your inquiries and letters to the MVLWB. Your participation in this process helped TerraX make a better, safer, and more sustainable submission. TerraX is fully aware that making promises on paper is vastly easier than physically carrying out those promises on the land. It is now our job to meet our commitments and safely carry out the permitted activities in an environmentally responsible manner within the conditions established by the Board and pertinent legislation. We look forward to continuing to develop our relationships within the local community as we define TerraX’s future exploration plans.”

In late March, 2014 TerraX commenced drilling on the Yellowknife City Gold Project, with the first drill hole was collared on the Northbelt Property. This marks the first drilling on the Northbelt since 1996, a period of 18 years.

TerraX’s first drill campaign will total approximately 6,000 m of drilling and test three initial target areas; the **Barney Shear**, which is the extension of the Con/Giant shear system; the **Crestaurem Zone**, which is a high grade zone with nearly 200 historical drill intersections; and the **Homer Lake** base metal/precious metal target at the north end of the property. The first drill hole was collared at Homer Lake to target a buried conductor identified by airborne surveys in 2013 that has never been drill-tested. This target area is within 500 m of a previously established ice road which makes winter access easier and with much less environmental impact than overland access in summer conditions. Although Crestaurem and the Barney Shear are currently TerraX’s highest priority gold targets, the logistics associated with Homer Lake access dictate that it be drilled first to take advantage of 6-8 weeks of ice road use before spring breakup.

Homer Lake is not a traditional gold target as would be expected in a major gold belt like the Yellowknife Gold Camp. It was originally discovered from surface prospecting in the 1930s and six mineralized structures were delineated during reconnaissance prospecting by TerraX in the Homer Lake area in 2013. One structure has been traced by TerraX for 1,200 m and has chip sample results of **7 m @ 0.50 g/t Au, 90.2 g/t Ag, 4.25% Pb and 0.89% Zn**. A parallel structure sampled by TerraX graded **5 m @ 1.54 g/t Au, 95.5 g/t Ag, 3.13% Pb and 1.59% Zn**. A grab sample by TerraX from a third structure graded **0.60 g/t Au, 529 g/t Ag, >20% Pb, and 9.44% Zn**. Historical reports of drilling on another structure included **6.10 m of 2.54 g/t Au, 204.0 g/t Ag, 10.82% Pb, 6.03% Zn and 0.55% Cu** in hole 38-02; this intersection was less than 50 m below surface. (This drill result is historical in nature, has not been verified by TerraX, and should not be relied upon.)

In July 2013 TerraX carried out an airborne electromagnetic (EM) survey which revealed a 1.2 km long, north-trending conductor at the Homer Lake target, 400 m of which is highly conductive. The source of this conductor is buried and 3-D modeling indicates a top of the conductor at approximately 110 meters below surface, with a steep westerly dip. None of the known surface mineralized zones mentioned above were conductive in the 2013 EM survey, and the buried conductor has never been tested by drilling. This conductor was the target of this initial 1,000 m drill program at Homer Lake, following which the drill rig was moved to the south end of the property in early April to commence drilling at Barney, where TerraX reported assay results from re-logging and sampling of core from historical drill holes that included **28.32 m @ 2.97g/t Au, inclusive of 4.00 m @ 12.59 g/t Au**, on the

Barney Shear Zone (news release of August 14, 2013).

The Barney Shear has been delineated over a strike length of 4.5 km by TerraX and previous workers and has only been drill tested by prior operators over a 600 m strike length. Surface mapping in June 2013 indicates that the Barney Shear Zone consists of multiple mineralized shears over a >200 m width. The 2014 Barney Shear drilling will consist of up to 8 holes following the strike extension of the shear up to 300 m north of the mineralization defined in drilling carried out by Nebex Resources Ltd. in 1995 and 1996. In addition, TerraX will be re-entering the collars of 4 drill holes from the 1995-96 campaigns. These holes will be surveyed down hole to accurately determine the location of previously intersected zones of mineralization, and then multiple wedges will be turned off the original holes to generate additional mineralized intersections. This work is possible as the previous exploration drilling had left the original drill hole collars cased and capped to preserve them for future work on this important mineralized zone.

On April 7, 2014 TerraX announced that it had mobilized a second drill and commenced drilling at the Crestaurum gold deposit at the south end of Northbelt, where the gold mineralized shear structure has been identified over 1.4 km of strike-length and is open along strike and down dip. The Crestaurum drilling will consist of 12-15 holes focusing on twinning historical holes from the 1940s to 1960s that did not have core available for relogging and re-sampling and infill drilling around 1985 drill holes that have been re-logged and re-sampled by TerraX in 2013. The aim of the Crestaurum drill program is to advance this zone of mineralization towards a mineral resource. The mobilization of this second drill was moved up to take advantage of excellent winter access conditions that are persisting in the project area.

The winter portion of TerraX's Phase 1 drill program at Northbelt was completed on April 25, 2014 with 14 holes drilled totalling 2,305 m, including 4 holes on Homer (1,001 m), 4 holes on Crestaurum (533 m), and 5 holes on the northern extension of the Barney Shear (751 m). The summer drill program is scheduled to begin on June 23, 2014 once water levels recede and ground conditions improve. A further 3,500 m of drilling is planned during the summer program, made up of approximately 1,000 m at Crestaurum and 2,500 m at the Barney Shear Zone.

On May 12, 2014 TerraX announced assay results from the four holes drilled at the Homer Lake base metal target.

Two holes, TNB14-003 and TNB14-004, were drilled to test the down dip extension of surface showings sampled by TerraX in 2013 (chip samples of **7.0m @ 0.50 g/t Au 90.2 g/t Ag, 4.25% Pb and 0.89% Zn**) and intersected felsic volcanics that are pervasively mineralized including multiple massive to semi-massive sulphide zones. Highlights include:

- **71.15m @ 0.25 g/t Au, 14.0 g/t Ag, 0.73% Pb and 0.57% Zn** in hole TNB14-004 (inclusive of **3.42m @ 3.41 g/t Au, 69.3 g/t Ag, 3.67% Pb, 3.17% Zn** in massive sulphides) and
- **60.87m @ 0.11 g/t Au, 10.4 g/t Ag, 0.58% Pb and 0.65% Zn** in hole TNB14-003;

The Homer Lake drill program was designed to test a 400m-500m long VTEM (electromagnetic) anomaly with an interpreted steep westerly dip that had been identified by airborne surveying in 2013 and continues for a further 1km as a weaker VTEM anomaly to the south. Two holes (TNB14-001 and TNB14-002) were drilled with an easterly azimuth on sections 100m apart and designed to intersect the northern end of the anomaly. Holes TNB14-003 and 004 were drilled to the east of the anomaly in an area where base metals were identified in historic trenches during 2013 field work (eg. chip samples of **7.0m @ 0.50 g/t Au 90.2 g/t Ag, 4.25% Pb and 0.89% Zn**). A map showing the location of these drill holes is available on our web site at www.terraxminerals.com.

Higher grade intervals occur within the mineralized felsic volcanic unit, and also in the adjacent mafic volcanics (see table). Within TNB14-004 these include **3.42m @ 3.41 g/t Au, 69.3 g/t Ag, 3.67% Pb and 3.17% Zn** within felsic volcanics; and **5.31m @ 0.40 g/t Au, 64.5 g/t Ag, 3.65% Pb and 2.64% Zn** at a felsic to mafic volcanic contact. Within TNB14-003 high grade intervals include **4.44m @ 0.16 g/t Au, 25.5 g/t Ag, 2.10% Pb and 2.59% Zn** at a mafic to felsic volcanic contact; **1.50m @ 1.70 g/t Au, 43.3 g/t Ag, 2.41% Pb and 2.04% Zn** in felsic volcanics; and **2.02m @ 0.34 g/t Au, 85.1 g/t Ag, 4.08% Pb and 3.72% Zn** at a felsic to mafic volcanic contact.

Joe Campbell, P.Geol, President of TerraX, states “The mineralization drilled in holes TNB14-003 and TNB14-004 is located along one of six sub-parallel zones of mineralization identified by TerraX in field work during the summer of 2013. Several of these zones have been traced over hundreds of meters of strike length on surface. While the high-grade gold targets at Northbelt remain our top priority, these wide zones of mineralization, coupled with the higher grade intervals of massive sulphides, are indicative of a large precious metal-rich base metal mineralized system in the Homer Lake area that definitely warrants further exploration when time and resources permit.”

The two holes drilled to intersect the northern end of the strong VTEM anomaly (TNB14-001 and TNB14-002) intersected multiple narrow massive to semi-massive sub-meter sulphide bands of pyrrhotite, ± pyrite, chalcopyrite, and arsenopyrite within massive to pillowed mafic volcanics, locally sheared proximal to mineralization. Collectively, these sulphide bands are interpreted to be the cause of the anomaly. In drill hole TNB14-001, on the extreme northern end of the anomaly, the most intense concentration of sulphide occurred from 118.0 to 172.0 m down hole, and in drill hole TNB14-002 collared 100m south of TNB14-001, the same zone occurred from approximately 114.0 to 171.0 m down hole.

These zones carried minor base metal mineralization, with single sample assays of up to 0.44% Cu in drill hole TNB14-001, and up to 0.20% Cu in TNB14-002. The sulphide zones returned sporadic gold values (highest assay **6.83 g/t over 0.71m** in TNB14-001 and **2.87 g/t over 0.57m** in TNB14-002). Two wider coherent intervals of low grade gold occurred within the best sulphide zones in TNB14-001, but gold values were more scattered throughout the same areas in TNB14-002. A third narrow zone of gold occurred in banded sulphides of pyrrhotite, ± chalcopyrite, and pyrite (intersection table below) at the bottom of both holes.

This strong VTEM anomaly is still untested over 300-400m of strike length to the south of TNB14-002. TerraX believes the amount of sulphides in this target area and the associated highly anomalous gold content are significant, and this target will receive mapping and prospecting attention this summer. In addition, the VTEM anomaly and associated magnetic signature will be remodeled to better define target potential by integrating the results from this drilling.

TerraX collected 871 samples for assay from the Homer Lake drilling. Results ranged from below detection in all metals to highs of 6.83 g/t Au, 261 g/t Ag, 13.55% Pb, 10.15% Zn, and 0.44% Cu, in separate samples. True thickness of the zones of mineralization is unknown at present. Based on core foliation angles it is estimated to be between 50-80% of drill intersection width.

On June 2, 2014 TerraX announced assay results from the final nine holes drilled during the winter drill at Northbelt. Four of these holes were drilled at Crestaurum (533m) and five holes were drilled to test the northern extension of the Barney Shear target (751m). Three of the holes drilled at Crestaurum were designed to twin historic drill holes for which no drill core is available and confirmed the correlation with historic drill results. Highlights include **10.02 m @ 4.17 g/t Au**, inclusive of **2.89 m @ 10.88 g/t Au**, in hole TNB14-011.

CRESTAURUM ZONE

In the summer of 2013 TerraX recovered core from 74 drill holes drilled into Crestaurum during 1985, and TerraX subsequently reported assay results of sampling of that core. Historical logs and assays for these holes were recovered in 2013, and collar locations were found in the field. Based on this information, TerraX is planning on drilling a total of 12 twin holes to verify historical logs and assays, with the remaining nine holes to be completed during the summer drill program which began on June 24, 2014.

The twin hole locations are designed to give TerraX spatial coverage of the known zone of mineralization over 1.4 km of strike and 150 m of dip length, and to provide a representative range of grade and thickness. This will include low, moderate and high grade intersections over narrow to wide zones at all grade ranges.

Results of TerraX's assays for the three Crestaurum twin holes drilled to date are tabulated below, along with the historical intervals for comparison. In general the holes intersected mineralization where expected, confirming the

location and thickness of the zones as indicated by the historical records. Grades showed some variation as would be expected for lode style quartz vein hosted gold deposits, but based on these three holes there appears to be good unbiased grade correlation with historical results. Two holes (TNB14-006 and 011) were drilled into the South Shoot and one hole (TNB14-012) was drilled a kilometer along strike in the North Shoot. If the good correlation continues with the remaining nine twin holes it will confirm historical drill results, and allow use of this information in the preparation of an NI 43-101 compliant resource estimate at Crestaurum.

Drill intersections at Crestaurum are considered to be normal to strike and dip and represent true thickness of the zone.

A fourth hole drilled by TerraX at Crestaurum was designed to intersect the interpreted mineralized zone at an acutely oblique angle to verify interpretations of zone geometry and check for alternative interpretations for zone geometry. This hole was collared at the wrong dip and azimuth and failed to intersect the zone. It will be re-drilled at a different orientation during the summer program.

BARNEY ZONE

Drilling at the Barney Zone was purely exploratory and designed to test the interpreted northern strike extension of the historically drilled mineralization (termed the Barney North Extension). Five drill holes were collared 150-250 meters north along the interpreted strike from the 1995-96 drill holes reported by TerraX on recovered historical core (**20.86 m @ 3.79 g/t Au**, including **4.00 m @ 12.34 g/t Au** in hole NB95-16 reported August 14, 2013). TerraX drilling was also designed to intersect the zones of mineralization closer to surface, at approximately 50-100 m below surface. This location is 150-300 m above the historical drill hole intersections. None of the historical drilling tested the shallow up-dip extensions of mineralization encountered in the deeper 1995-96 drill holes.

Drill results from the Barney North Extension are listed in the table below. The initial hole (TNB14-007) intersected the host shear structure, but was devoid of mineralization. Encouraged by the discovery of the shear zone, hole TNB14-008 was drilled directly under TNB14-007 and encountered quartz carbonate veining with significant sulphides, including galena, arsenopyrite and pyrite. This hole intersected **6.00m @ 1.49 g/t Au, 12.3 g/t Ag and 0.50% Pb**, including **2.20m @ 3.63 g/t Au**.

A further hole (TNB14-009) was drilled to intersect the zone approximately 25 m south of holes TNB14-007 and 008. This hole was again designed to intersect the zone at shallow depths, but in this case it was weakly mineralized with an intersection of 0.96m @ 1.04 g/t Au, 24.1 g/t Ag and 0.93% Pb. TerraX then drilled a hole (TNB14-010) approximately 25m south and 50m down dip of the intersection in TNB14-009. The shear zones became significantly wider with multiple zones of better mineralization, including a central zone of **12.50m @ 1.40 g/t Au, 20.3 g/t Ag and 1.69% Pb, including 4.00m @ 3.62 g/t Au.**

The final hole (TNB14-014) was drilled 100m north of holes TNB14-007 and 008 to target the interpreted host shear zone at shallow depth. This hole was stopped at 78m depth as spring breakup required shutdown and removal of the drill. Regardless, the hole had entered a zone of shearing corresponding to the interpreted Barney North Extension and although only at a very shallow depth (approximately 40m vertical) it was weakly mineralized returning 2.97m @ 0.46 g/t Au in a zone of quartz carbonate veining and shearing.

and	52.59	55.56	2.97	0.46		

True thickness of the zones at the Barney North Extension of mineralization is unknown at present. Based on core foliation angles it is estimated to be between 60-90% of drill intersection width.

The drilling on the Barney North Extension has confirmed that the Barney Zone of mineralization continues for at least 250 meters further north and a similar distance up-dip of historical drilling. Based on 2014 drilling results the

mineralized zones are strengthening and widening with depth. The initial 2014 drilling has greatly extended the target area for the Barney Zone and this mineralization will be followed down-dip and further north along strike in future drilling.

TerraX collected 504 samples for assay from the Crestaurum drilling, and 583 samples from the Barney North Extension drilling. Results ranged from below detection in all metals to highs of 21.30 g/t Au, 169 g/t Ag, and 14.30% Pb, in separate samples.

Drill hole collar locations were surveyed to sub-meter accuracy. Down hole surveying (Easy Shot and Maxibor) was completed on all holes. Core sampling included insertion of certified standards and blanks. Drill core samples are cut by diamond saw at TerraX's core facility in Yellowknife. A halved core sample is left in the core box. The other half core is sampled and transported by TerraX personnel in securely sealed bags to ALS Chemex's preparation laboratory in Yellowknife. After sample preparation, samples are shipped to ALS Chemex's Vancouver facility for gold and ICP analysis. Gold assays of > 3 g/t are re-assayed on a 30 gm split by fire assay with a gravimetric finish. Silver ICP results over 100 g/t and lead ICP over 5000 ppm are subjected to ore grade analyses. ALS is a certified and accredited laboratory service. ALS routinely inserts certified gold standards, blanks and pulp duplicates, and results of all QC samples are reported.

On June 25, 2014 TerraX re-commenced drilling, following spring breakup, at the Barney Shear Zone. The first drill holes will be wedges to test the up dip extension of the Barney Shear Zone off relatively deep drill holes drilled by Nebex Resources in 1995 and 1996 that intersected the Barney Shear Zone at vertical depths of 240 to 280 meters below surface. The holes were left cased and capped to allow re-entry for further exploration of this zone. The previous drilling by Nebex were single holes per cross-section, and the wedges to be completed by TerraX will create multi-hole sections for geological modelling and potentially allow TerraX to complete an initial inferred resource estimate at Barney utilizing drill logs and core available to TerraX from the Nebex drilling.

Following drilling on the Barney Zone, TerraX will be drilling several holes on the Crestaurum zone to complete a program that began in April of this year in areas of historical holes drilled between 1945 and 1947. TerraX plans on leveraging historical exploration data to continue defining the extent and controlling structures of known mineralization on the Crestaurum and Barney shears, with the potential of establishing a modern resource estimate for both deposits this year. As well, ongoing field exploration (see June 17, 2014 News Release) will generate and prioritize targets for future drill programs on the multiple shears identified during TerraX's 2013 exploration program and over 70 years of historical exploration records.

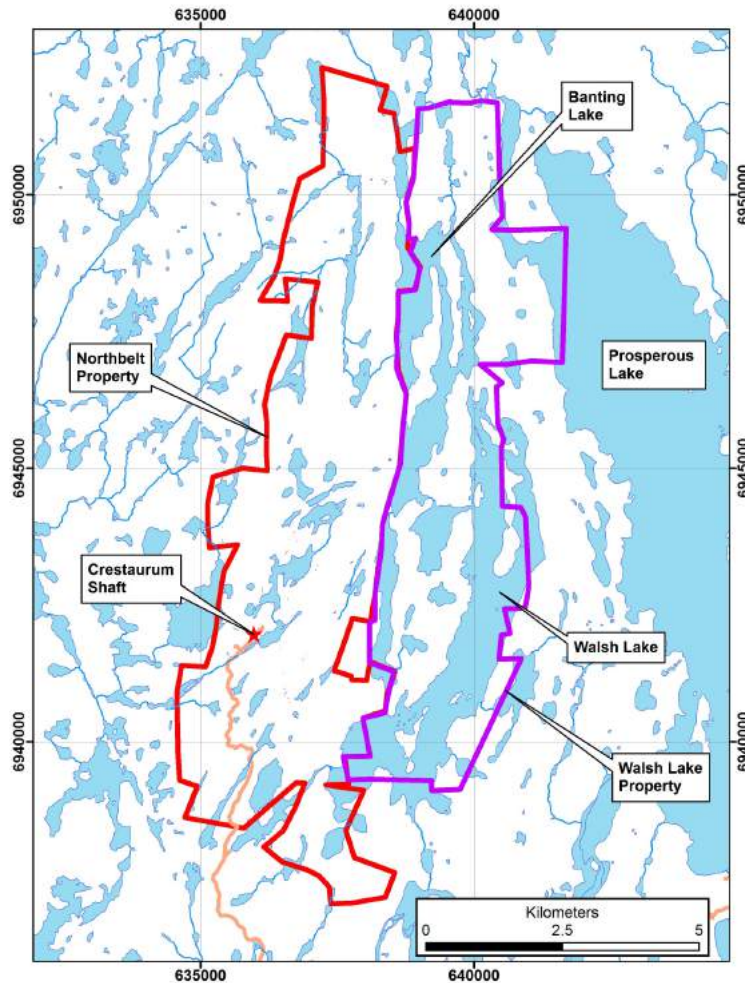

The technical information contained in this disclosure has been approved by Joseph Campbell, the President of TerraX, who is a Qualified Person as defined in "National Instrument 43-101, Standards of Disclosure for Mineral Projects."

During the three months ended April 30, 2014 the Company incurred \$659,306 in exploration on the Northbelt property, inclusive of geological consulting (\$158,956), assays (\$313,726) and field expenses (\$186,624).

Walsh Lake Property, Northwest Territories

On October 28, 2013 TerraX entered into an option agreement whereby it can acquire a 100% interest in the Walsh Lake property, which is contiguous with and immediately east of the Northbelt property. The Walsh Lake property consists of seven leases and five claims totaling 6,659 acres (26.95 sq km). Historical exploration on the property has produced grab samples as high as 150 g/t Au and drill intersections as high as 15.85 m @ 2.59 g/t Au.

During due diligence field work conducted during September 2013 TerraX visited eleven different showings on the Walsh Lake property, sampling trenches and exposed showings. Gold results ranged from below detection to a chip sample of **1 m @ 30.8 g/t Au**, with each showing returning at least one anomalous (>100 ppb Au) sample. Results confirm that anomalous to significant gold concentrations are widespread on the property. TerraX's sampling produced chip sample assays as high as **6 m @ 7.29 g/t Au**. Highlights of this field work are summarized in the following table. A map showing the location of the sampling referenced below is available on our web site at www.terraxminerals.com.

Results of TerraX's September 2013 Surface Sampling, Walsh Lake Property

Showing	Length (m)	Au (g/t)
Sam Otto	5.0	1.90
Mispickel Island	4.0	3.55
Mispickel Island	6.0	7.29
<i>including</i>	1.0	30.80
Samex	4.0	6.20
<i>including</i>	1.0	22.30
Nib Central	4.0	1.51
Nib North	3.0	1.45

The Walsh Lake property is underlain by Archean felsic volcanics and sediments. The structural regime on the Walsh Lake and Northbelt properties appears to be similar, with gold on the Walsh Lake property occurring in subvertical, NNW to NNE trending shear zones and associated quartz veins and biotite or sericite schists. TerraX

can acquire a 100% interest in the Walsh Lake property over a four year period by making option payments totaling \$90,000 (\$5,000 on signing and \$10,000 on the first anniversary of signing), issuing 260,000 shares (30,000 shares in the first year) and funding \$400,000 of exploration expenditures (\$25,000 in the first year). The vendor will retain a 2% NSR, of which 1.5% can be purchased by TerraX for \$2 Million.

TerraX has not completed a detailed compilation of the property, but as part of its due diligence has reviewed several reports and spent two days in September 2013 collecting samples from trenches and showings. The property has been intermittently explored since the 1930's, including campaigns by Barrick Gold, Rubicon Minerals, Inmet Mining, and Nebex Resources Ltd. This previous exploration activity has included prospecting, mapping, soil geochemistry, airborne geophysics, Induced Polarization (ground geophysics), excavation of numerous trenches, and the drilling of at least 101 drill holes. Numerous anomalous trench and drill hole intersections have been reported, with highlights summarized in the following tables:

Results of Historical Grab and Trench Sampling, Walsh Lake Property

UBreccia Property, Northwest Territories

In March 2014 TerraX entered into a purchase agreement for the UBreccia property, which is contiguous with and immediately west-southwest of the Northbelt property. The UBreccia property consists of three claims totalling

1,394 hectares; it is being purchased from Panarc Resources Ltd for 75,000 common shares, subject to acceptance for filing by the TSX Venture Exchange. Panarc will retain a 1% NSR, of which 0.5% can be purchased by TerraX at any time for \$1,000,000. A property location map is available on the TerraX website at www.terraxminerals.com.

The property is bisected by the major, late, north to north-northwest trending West Bay and Akaitcho faults, which intersect on the property. These faults displace the Con and Giant ore systems approximately 5 km south of the property. The West Bay Fault also serves as the western boundary for the Yellowknife Greenstone Belt in this area. Mafic rocks of the greenstone belt comprise on the order of one third of the property; the remainder is underlain by felsic plutonic rocks of the Defeat Plutonic Suite.

Gold occurs in shears, quartz veins and fault breccias associated with late north-northwest trending structures in the Defeat Plutonic Suite on the Uptown Property, which adjoins the UBreccia Property to the south. Grab samples with up to 113.5 g/t Au have been obtained from these structures (Technical Report, April 13, 2013; North Sur Resources Inc., www.sedar.com). Preliminary prospecting on the property by Panarc revealed the presence of silicified and hematized fault breccias up to 100 m wide with minor gold anomalism (up to 94 ppb).

TerraX acquired the UBreccia property partly to explore for structurally controlled gold in late faults in the Default Plutonic Suite, but mainly to explore for more conventional mesothermal gold deposits in the Yellowknife Greenstone Belt. At least four mineralized structures identified by TerraX and previous operators on the Northbelt property project onto the UBreccia property. The Island Lake Shear, a possible extension of the Crestaurum Shear, returned a chip sample of **1 m @ 27.9 g/t Au** less than 1 km from the UBreccia property (TerraX News Release, November 6, 2013). The AES shear produced a grab sample of **12.85 g/t Au** 4.2 km from the UBreccia property; this structure clearly strikes onto the property. The Finger Lake and Raven Lake shears have not been properly explored by TerraX, but have been identified as gold-bearing by previous workers; both strike onto the UBreccia property. Each of the structures potentially has between 750 and 1,200 m of prospective strike length on the UBreccia property and within the Yellowknife Greenstone Belt.

The technical information disclosed above has been approved by Tom Setterfield, Vice President Exploration of TerraX, who is a Qualified Person as defined in "National Instrument 43-101, Standards of Disclosure for Mineral Projects."

2014 Field Exploration Commences at Yellowknife City Gold Project

In mid June 2014 TerraX commenced summer field exploration programs at the Yellowknife City Gold Project. Work will include mapping and prospecting and surveying over the contiguous Northbelt, Walsh Lake, U-Breccia and Ryan Lake properties that make up the approximately 8,400 hectare project area.

Summer surface work will cover multiple high value target areas on the Yellowknife City Gold project. A concerted mapping and prospecting effort will be made on the Walsh Lake property following up positive results from surface sampling completed by TerraX in 2013, over only a two day period, that included chip sampling of 6m @ 7.29 g/t Au at the Mispickel Island showing, and 4m @ 6.20 g/t Au on the Samex showing (news release of Oct 30, 2013). On Northbelt work will continue to follow up on zones discovered by TerraX during 2013 field work including the Crestaurum Southwest Zone (chip sampling of 4.0m @ 24.26 g/t Au reported Nov. 6, 2013), and the Pinto Shear (grab sample of 49.3 g/t Au reported July 3, 2013). TerraX will also be conducting initial exploration along projected extensions of areas previously mined by Giant Mines along the southern boundary of the property (Lynx, GBK, C-Zone).

As well TerraX has contracted for a LIDAR survey (Light Detection and Ranging) to be carried out in June 2014 over the entire YCGP. This survey will provide detailed elevation data of bare earth and vegetated terrain models, as well as a high resolution airphoto mosaic. This information will allow TerraX to trace mineralized shear zones (locally topographic lows); provide surface modelling for future NI 43-101 mineral resource estimation; and be an invaluable tool for detailed collar location planning for exploration and definition drill programs.

TerraX plans to undertake a detailed compilation of previous work prior to formulating an exploration plan for the Walsh Lake property.

The technical information reported above has been approved by Tom Setterfield, Vice President Exploration of TerraX, who is a Qualified Person as defined in "National Instrument 43-101, Standards of Disclosure for Mineral Projects."

Option of Central Canada property to Alberta Star Development Corp. and Private Placement of \$585,000

On February 28, 2014 TerraX and Alberta Star entered into an option agreement (the "**Option Agreement**") pursuant to which Alberta Star may earn a 60% interest in TerraX's wholly-owned Central Canada gold project in Ontario (the "**Option**") and will subscribe for 1,300,000 units of TerraX "**Units**") at \$0.45 per Unit for gross proceeds of \$585,000 (the "**Private Placement**").

In order to exercise the Option, Alberta Star must make cash payments to TerraX totalling \$85,000 over a three year period, with \$10,000 paid upon execution of the Option Agreement, \$25,000 due on the second anniversary of the execution of the Option Agreement and a further \$50,000 due on the third anniversary date. Alberta Star must also incur an aggregate of \$500,000 in exploration expenditures over a three year period, with \$100,000 to be incurred by March 31, 2015, a further \$150,000 to be incurred by March 31, 2016 and the remaining \$250,000 to be incurred by March 31, 2017. Alberta Star will also be responsible for payment of the annual pre-production royalty of \$10,000 to the original vendors of the Central Canada Property due annually in December beginning with the next payment due on December 11, 2014.

The Private Placement was closed on February 28, 2014, with each unit consisting of one common share and one-half of one share purchase warrant, with each full warrant entitling the holder to purchase an additional common share at an exercise price of \$0.57 per share until February 28, 2016. No finder's fees were paid in connection with this placement. All securities issued in connection with the placement are subject to a hold period expiring on July 1, 2014

Mr. Stuart Rogers, a director and the Chief Financial Officer of TerraX, is also a director and the President and Chief Executive Officer of Alberta Star. Mr. Rogers beneficially owns or controls 339,000 common shares and 300,000 securities convertible into common shares of Alberta Star, representing 1.56% of the outstanding common shares of Alberta Star on a non-diluted basis and 2.89% of the outstanding common shares of Alberta Star on a diluted basis. On completion of the Private Placement, Alberta Star owned 3.04% of the outstanding common shares of TerraX on a non-diluted basis and 4.49% of the outstanding common shares of TerraX on a diluted basis. Mr. Rogers has declared his interest in, and abstained from voting in respect of, the Option and the Private Placement on behalf of TerraX and Alberta Star. The directors of each of TerraX and Alberta Star have considered the merits of the Option and the Private Placement in the absence of Mr. Rogers. The Option and Private Placement are exempt from the formal valuation and minority approval requirements of Multilateral Instrument 61-101 pursuant to sections 5.5(b) and 5.7(1).

The **Central Canada Property** consists of seven claims totaling 24 claim units (~3.8 km²) located 20 km east of the town of Atikokan, 160 km west of Thunder Bay and 19 km from the Hammond Reef gold deposit owned by Osisko Mining Corporation.

The Central Canada Property straddles the southern contact of the Marmion Batholith, host to the Hammond Reef deposit and TerraX's Blackfly property. The bulk of the property is underlain by mafic rocks outside the batholith; these have been intruded by abundant felsic dikes presumably related to the Marmion Batholith. Gold mineralization is associated with quartz-iron carbonate veins with minor pyrite and local tourmaline and/or arsenopyrite. These veins are most common in or close to felsic dikes. Dikes and veins trend easterly, parallel to the contact of the Marmion Batholith and to the strike of the regional scale Quetico Fault, which also occurs on the property. TerraX conducted due diligence on the property in October 2009, collecting 18 grab samples of veins and alteration. Assay values range from 9 ppb to **22.9 g/t gold**, and seven samples had >250 ppb Au. This includes results of **2.8, 4.48 and 22.9 g/t gold**.

Induced Polarization (“IP”) and magnetic surveys were conducted on the Central Canada Property by TerraX in February/March 2010 and two chargeability anomalies were detected, one of which was roughly coincident with the 22.9 g/t Au sample with the other occurring in an area not previously investigated by TerraX.

A comprehensive prospecting program was carried out on the Central Canada Property in June 2010. Extensive zones of shearing and carbonate-chlorite-sericite alteration with quartz veining were noted across the property. This prospecting program collected 21 new grab samples. Results ranged from below detection to a high of **39.6 g/t Au** on a sample collected near the circa 1900 shaft that occurs on the property. Importantly, two samples of approximately 1 g/t Au (907 and 1070 ppb) were taken from a new showing 500 m northeast of the shaft. This showing consists of a northeast trending sericite carbonate shear with disseminated to semi-massive pyrite and arsenopyrite. This was followed up with Channel sampling in September 2010. One hundred and twenty-three channel samples were collected over a strike length of approximately 120 m, perpendicular to a series of easterly trending quartz-carbonate-pyrite veins and felsic dikes. Twenty-four samples contained anomalous gold (20 ppb or higher), with a high value of 7.5 g/t Au.

Based on these results and historical information, TerraX commenced drilling at the Central Canada Property in March 2012. Three holes (363 m) were drilled approximately 55 meters apart to test a 110 m strike length of the main mineralized structure, which trends east-northeast. Drill holes were aligned to cut normal to the mineralized structures identified in the channel sampling. Drill intersections from southwest to northeast include **23.30 m @ 0.83 g/t Au** (including **0.63 m @ 7.36 g/t Au**) in hole CC12-03, **10.61 m @ 1.32 g/t Au** (including **1.82 m @ 4.77 g/t Au**) in hole CC12-01, and **8.92 m @ 0.74 g/t Au** in hole CC12-02. Alberta Star’s exploration activities this year will be designed to follow-up on the initial 363 m drill program conducted by TerraX and determine the overall size of the mineralized structure, which remains open along strike and down-dip. A map showing the location of the drilling conducted at Central Canada is available on TerraX’s web site at www.terraxminerals.com

Private Placements

On February 12, 2014 TerraX closed a non-brokered private placement of 1,500,000 units at \$0.45 per unit, with two placees, for gross proceeds of \$675,000. Each unit consists of one common share and one-half of one share purchase warrant, with each full warrant entitling the holder to purchase an additional common share at an exercise price of \$0.51 per share until February 12, 2016. The shares and any shares acquired on the exercise of warrants will be subject to a hold period expiring on June 13, 2014. Finders' fees of \$31,500 were paid with respect to this placement along with the issuance of 70,000 finders' warrants exercisable at \$0.51 until February 12, 2016.

On February 28, 2014 the Company completed a private placement with Alberta Star Development Corp. (described in more detail above), with each unit consisting of one common share and one-half of one share purchase warrant, with each full warrant entitling the holder to purchase an additional common share at an exercise price of \$0.57 per share until February 28, 2016. No finder’s fees were paid in connection with this placement. All securities issued in connection with the placement are subject to a hold period expiring on July 1, 2014

Options Granted

On March 14, 2014 TerraX granted 1,050,000 stock options to directors and consultants at an exercise price of \$0.75 per share for a five year period from the date of grant. These options vested immediately.

On May 5, 2014 TerraX granted incentive stock options on up to 500,000 common shares at an exercise price of \$0.61 per share for a five year period from the date of grant. These incentive stock options were granted to Paradox Public Relations Inc., the Company’s investor relations consultants, and are subject to vesting provisions in accordance with TSX Venture Exchange policies.

Current Economic Conditions

During early calendar 2014, the ongoing global credit crisis and economic weakness have made for extremely volatile capital markets characterized by weaker equity prices for mineral exploration companies and an environment

in which limited opportunities existed to raise additional capital. While stronger commodity prices have provided financing opportunities which TerraX has capitalized on in the past to augment its working capital, management of the Company remains cautious and will continue to take the necessary precautions to maintain its cash reserves. The Company has commitments in the future (later this fiscal year and beyond) on its mineral properties and the Company may be forced to abandon and write-off one or more of these properties if the Company does not have the means to meet these commitments, or does not feel it is fiscally prudent to do so. In order to conserve cash, TerraX elected not to make the annual pre-production royalty payment on the Sunbeam-Pettigrew property when due in April 2013 and returned the property to the vendors while it was still in good standing, thus avoiding further provincial work obligations that would come due in 2014.

With the completion of private placements for gross proceeds of \$675,000 and \$585,000 in February 2014 the Company currently has sufficient cash to meet all obligations during through fiscal 2015. While the Company elected to write-down the carrying value of its Blackfly property during the fiscal year ended January 31, 2014, management does not believe that the abandonment of any of its other mineral properties is required at this time. However, the Company will be reviewing its mineral property commitments as well as its working capital position on an ongoing basis during fiscal 2015 and may elect to abandon properties when obligations become due if management deems it necessary in order to maintain the long-term viability of the Company.

Results of Operations – Three months ended April 30, 2014

Operating expenses for the three months ended April 30, 2014 totaled \$956,325 as compared to \$63,633 incurred during the three months ended April 30, 2013. The significant differences in expenditures were as follows:

Consulting expense increased to \$18,350 during the three months ended April 30, 2014 from \$8,025 incurred during the same period a year prior due to the resumption of investor presentations during the current period in order to facilitate the completion of private placements in February of 2014.

Office, rent and miscellaneous expenses increased to \$9,755 during the three months ended April 30, 2014 due primarily to increased charges for office rent and administration services during the current period. This compares to expenditures totaling \$4,852 during the same period a year prior.

Professional fees increased to \$12,506 during the three months ended April 30, 2014 due to legal fees incurred with respect to the completion of two private placements during the period. This compares to professional fees of \$9,491 incurred during the same period a year prior.

During the three months ended April 30, 2014 the company incurred \$795,217 for share-based payments (a non-cash item) for stock options granted and vested during the period. There was no comparable expense during the same period a year prior when there was no granting of options.

The Company spent \$95,260 for transfer agent, filing fees and shareholder communications during the three months ended April 30, 2014, an increase from the \$33,109 incurred during the same period a year prior primarily due to increased expenditures in the current period on investor relations consultants, investor presentations, news dissemination and advertising.

Travel expenditures of \$25,237 were incurred during the current period for travel required to attend trade shows and for broker presentations. This compares to travel expenses of \$8,156 incurred during the three months ended April 30, 2013.

During the three months ended April 30, 2014 the Company earned interest income of \$5,951 on cash equivalents on hand. There was no interest income earned during the same period a year prior.

As a result of the foregoing, the Company recorded a comprehensive loss for three months ended April 30, 2014 of \$950,374 as compared to a loss of \$63,633 during the same period a year prior.

Summary of Quarterly Results

	Q1-2015	Q4-2014	Q3-2014	Q2-2014	Q1-2014	Q4-2013	Q3-2013	Q2-2013
Net loss (\$)	950,374	1,085,611	197,016	293,292	63,633	1,244,736	56,501	43,587
Per Share (\$)	0.02	0.03	0.01	0.01	0.00	0.05	0.00	0.00

During the second quarter of fiscal 2013, the loss increased to \$43,587 from the loss of \$39,742 incurred during the first quarter primarily due to a share-based payment expense of \$5,185 incurred during the period.

The loss for the third quarter of fiscal 2013 increased to \$56,501 from the loss of \$43,587 incurred during the second quarter primarily due to an additional share-based payment expense incurred during the current period for the granting of options.

The loss for the fourth quarter of fiscal 2013 increased to \$1,244,736 from the \$56,501 incurred during the prior quarter primarily due to a \$1,162,831 write-off of exploration and evaluation assets related to the Sunbeam-Pettigrew property in Ontario subsequent to the period.

The loss for the first quarter of fiscal 2014 decreased to \$63,633 from the loss of \$1,244,736 incurred during the fourth quarter of fiscal 2013 primarily due to the elimination of the write-off of \$1,162,831 incurred during the prior period on the abandonment of exploration and evaluation assets.

The loss for the second quarter of fiscal 2014 increased to \$293,292 from the loss of \$63,633 incurred during the first quarter primarily due to share-based payment expense of \$211,216 incurred during the current period for options granted and vested during the period along with additional shareholder communication and travel expenses.

The loss for the third quarter of fiscal 2014 was reduced to \$197,016 primarily because of a reduction in share-based payments expense to \$68,017, a non-cash expense, from the \$211,216 incurred during the second quarter when a larger number of incentive stock options were granted to management, directors and consultants. This reduction was partially offset by increases in shareholder communication and travel expenses during the current quarter.

The loss for the fourth quarter of fiscal 2014 increased to \$1,085,611 from the loss of \$197,016 incurred during the third quarter primarily due to an additional share-based payment expense, a non-cash item, of \$392,189 for options granted and vested during the period and a write-down of \$561,177 with respect to the Blackfly property.

The loss for the first quarter of fiscal 2015 decreased to \$950,374 from the loss of \$1,085,611 incurred during the fourth quarter of fiscal 2014 primarily due to the elimination of the write-off of \$561,177 incurred during the prior period on the write-down of the Blackfly property, offset by an increase in share-base payment expense to \$795,217 during the current period.

Liquidity and Solvency

TerraX is in the development stage and therefore has no regular cash flow. As at April 30, 2014 the Company had working capital of \$2,032,303, inclusive of cash and cash equivalents of \$2,206,010. This compares to working capital at January 31, 2014 of \$1,536,910, inclusive of cash and cash equivalents of \$1,655,703.

As at April 30, 2014, the Company had current assets of \$2,454,424, total assets of \$5,907,929 and total liabilities of \$422,121. The Company has no long-term debt. There are no known trends in the Company's liquidity or capital resources.

The principal assets of the Company are its mineral exploration properties, amounting to \$3,385,505 as at April 30, 2014.

The increase in cash during the three months ended April 30, 2014 of \$550,307 was due to net cash received from completion of private placements in February 2014 and the exercise of warrants and options of \$1,372,771, offset by

cash used for security deposits and mineral property acquisition and exploration of \$722,220 and cash used by operating activities of \$100,244. During the three months ended April 30, 2013, cash decreased by \$148,848 as a result of cash spent on mineral property acquisition and exploration of \$273,260 and cash used by operating activities of \$5,588, offset by cash received from advances on a private placement of \$130,000.

In February of 2014 the Company completed two private placements for gross proceeds of \$1,260,000. The net proceeds from this placement, along with cash on hand, will be sufficient to fund the Company's planned exploration activities through fiscal 2015 as well as its general and administrative expenses through the same period. As at the date of this report, the Company has approximately \$1.5 Million in cash and cash equivalents.

Cash flow to date has not satisfied the Company's operational requirements. The development of the Company in the future will depend on the Company's ability to obtain additional financings. In the past, the Company has relied on the sale of equity securities to meet its cash requirements. Future developments, in excess of funds on hand, will depend on the Company's ability to obtain financing through joint venturing of projects, debt financing, equity financing or other means. There can be no assurances that the Company will be successful in obtaining any such financing or in joint venturing its property; failure to obtain such additional financing could result in the delay or indefinite postponement of further exploration and development of the Company's properties.

Risk, Uncertainties and Outlook

The business of mineral deposit exploration and extraction involves a high degree of risk. Few properties that are explored ultimately become producing mines. At present, none of the Company's properties has a known commercial ore deposit. Other risks facing the Company include competition for mineral properties, environmental and insurance risks, fluctuations in metal prices, fluctuations in exchange rates, share price volatility and uncertainty of additional financing.

Going concern

The Company is in the exploration stage and has no revenue or income from operations. The Company has limited capital resources and has to rely upon the sale of equity and/or debt securities for cash required for exploration and development purposes, for acquisitions and to fund the administration of the Company. Since the Company does not expect to generate any revenues from operations in the near future, it must continue to rely upon the sales of its equity or debt securities or joint venture agreements to raise capital. It follows that there can be no assurance that financing, whether debt or equity, will be available to the Company in the amount required by the Company at any particular time or for any period and that such financing can be obtained on terms satisfactory to the Company.

The Company's financial statements have been prepared on a going concern basis which assumes that the Company will be able to realize its assets and discharge its liabilities in the normal course of business for the foreseeable future. The continuing operations of the Company are dependent upon its ability to obtain the necessary financing to meet its ongoing commitments and further its mineral exploration programs.

The Company may encounter difficulty sourcing future financing in light of the recent economic downturn. The current financial equity market conditions and the inhospitable funding environment make it difficult to raise capital through the private placements of shares. The junior resource industry has been severely affected by the world economic situation as it is considered speculative and high-risk in nature, making it even more difficult to fund. While the Company is using its best efforts to achieve its business plans by examining various financing alternatives, there is no assurance that the Company will be successful with any financing ventures.

Related Party Transactions

During the three months ended April 30, 2014, \$9,000 (2013 - \$4,500) was paid to a private company wholly-owned by Stuart Rogers, a director and officer of the Company, for office rent and administration services provided to the Company.

During the three months ended April 30, 2014, the Company paid \$117,566 (2013 - \$33,719) to a private company

in which Joseph Campbell, the President of the Company, and Thomas Setterfield, a director of the Company, are principals for geologic consulting services incurred on the Company's properties during the current period. In addition, a further \$10,350 (2013- \$8,025) was paid to this same private company for consulting services provided during this same period.

These transactions were in the normal course of operations and were measured at the exchange amount as agreed to by the related parties.

Financial risk management

The Company is exposed in varying degrees to a variety of financial instrument related risks. The Board of Directors approves and monitors the risk management processes, inclusive of documented investment policies, counterparty limits, and controlling and reporting structures. The type of risk exposure and the way in which such exposure is managed is provided as follows:

Credit risk

Credit risk is the risk that one party to a financial instrument will fail to discharge an obligation and cause the other party to incur a financial loss. The Company's primary exposure to credit risk is on its cash held in bank accounts. The majority of cash is deposited in bank accounts held with a major bank in Canada. As most of the Company's cash is held by one bank there is a concentration of credit risk. This risk is managed by using major banks that are high credit quality financial institutions as determined by rating agencies. The Company's secondary exposure to risk is on its other receivables. This risk is minimal as receivables consist primarily of refundable government goods and services taxes.

Liquidity risk

Liquidity risk is the risk that the Company will not be able to meet its financial obligations as they fall due. The Company has a planning and budgeting process in place to help determine the funds required to support the Company's normal operating requirements on an ongoing basis. The Company ensures that there are sufficient funds to meet its short-term business requirements, taking into account its anticipated cash flows from operations and its holdings of cash and cash equivalents.

Historically, the Company's sole source of funding has been the issuance of equity securities for cash, primarily through private placements. The Company's access to financing is always uncertain. There can be no assurance of continued access to significant equity funding.

Foreign exchange risk

The Company's functional currency is the Canadian dollar. All of its major expenses are transacted in Canadian dollars and the Company maintains all of its cash in Canadian dollars. As such, the Company has no immediate exposure to fluctuations in foreign exchange rates at the present time.

Interest rate risk

Interest rate risk is the risk that the fair value of future cash flows of a financial instrument will fluctuate because of changes in market interest rates. The Company is exposed to interest rate risk on its cash equivalents as these instruments have original maturities of three months or less and are therefore exposed to interest rate fluctuations on renewal. A 1% change in market interest rates would have an impact on the Company's net loss of approximately \$22,000 over the course of a year.

Capital Management

The Company's policy is to maintain a strong capital base so as to maintain investor and creditor confidence and to sustain future development of the business. The capital structure of the Company consists of equity, comprising share capital, net of accumulated deficit.

There were no changes in the Company's approach to capital management during the period.

The Company is not subject to any externally imposed capital requirements.

Classification of financial instruments

Financial assets included in the statement of financial position are as follows:

	April 30, 2014	January 31, 2014
FVTPL:		
Cash and cash equivalents	\$ 2,206,010	\$ 1,655,703

Financial liabilities included in the statement of financial position are as follows:

	April 30, 2014	January 31, 2014
Non-derivative financial liabilities:		
Trade payables	\$ 281,993	\$ 58,303
Due to related parties	120,128	78,477
	\$ 402,121	\$ 136,780

Fair value

The fair value of the Company's financial assets and liabilities approximates the carrying amount.

Financial instruments measured at fair value are classified into one of three levels in the fair value hierarchy according to the relative reliability of the inputs used to estimate the fair values. The three levels of the fair value hierarchy are:

- Level 1 – Unadjusted quoted prices in active markets for identical assets or liabilities;
- Level 2 – Inputs other than quoted prices that are observable for the asset or liability either directly or indirectly; and
- Level 3 – Inputs that are not based on observable market data.

The following is an analysis of the Company's financial assets measured at fair value as at April 30, 2014 and January 31, 2014:

	As at April 30, 2014		
	Level 1	Level 2	Level 3
Cash and cash equivalents	\$ 2,206,010	\$ -	\$ -
	As at January 31, 2014		
	Level 1	Level 2	Level 3
Cash and cash equivalents	\$ 1,655,703	\$ -	\$ -

Contingencies

The Company is aware of no contingencies or pending legal proceedings as of June 27, 2014.

Off Balance Sheet Arrangements

The Company has no Off Balance Sheet arrangements.

Equity Securities Issued and Outstanding

The Company had 43,782,540 common shares issued and outstanding as of June 27, 2014. In addition, there were 5,005,000 incentive stock options and 7,794,079 share purchase warrants outstanding as of June 27, 2014.

Disclaimer

The information provided in this document is not intended to be a comprehensive review of all matters concerning the Company. It should be read in conjunction with all other disclosure documents provided by the Company, which can be accessed at www.sedar.com. No securities commission or regulatory authority has reviewed the

accuracy or adequacy of the information presented herein.

Certain statements contained in this document constitute “forward-looking statements”. Such forward-looking statements involve known and unknown risks, uncertainties and other factors which may cause the actual results, performance, or achievements of the Company to be materially different from any future results, performance, or achievements expressly stated or implied by such forward-looking statements. Such factors include, among others, the following: mineral exploration and development costs and results, fluctuation in the prices of commodities for which the Company is exploring, competition, uninsured risks, recoverability of resources discovered, capitalization requirements, commercial viability, environmental risks and obligations, and the requirement for obtaining permits and licenses for the Company’s operations in the jurisdictions in which it operates.
